Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Left main gear collapsed from wing strut/wing connection (spar) on down. Wheel, strut (assembly), strut cover and wheel pants remained intact and seems like the whole strut assembly swung rearward. Aircraft came to rest on left side, sitting on top of the wheel assembly (primarily on wheel pants). The inspection panel on top of wing snapped off and created two identical cracks (on either side) of the inspection/service hole. No other damage to aircraft. No damage to airport property.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The flight for the day was an instructional flight with a Private Pilot student, Joshua Tarr. Flight was conducted in VFR conditions. The purpose of that day's flight was pattern work and landings. Both the student and I completed a thorough pre-flight inspection of the aircraft, which we found no squawks/issues. We completed the routine run-up, verified and got weather information, and got our clearance (was given a squawk code) to remain in the pattern. We departed around 1945 local time. We completed 8 circuits, one with a go around (never landing the aircraft) and 7 touch-and-goes with the 7th landing being the final full stop landing. All landings were completed within standard (65kts on final, 2 notches of flaps "25 degrees", on glide slope and with minimal stress on the aircraft (i.e. bouncing and/or hard landings). The weather prior, during and after the flight was clear skies and light winds out of the east.

Upon our final landing, we landed a couple hundred feet past the 1000ft markers on centerline. During roll-out I explained to the student that we would need to apply gentle braking action to slow the aircraft down for us to be able to taxi off runway 18 at Delta taxiway. During the whole phase of landing and roll-out, I was hovering over the controls with slight input to direct proper control input. After crossing runway 09/27 I felt a slight dip-like bump on the left side of the aircraft (as if the tire went flat) and applied brief right rudder just to make sure we remained centerline. Not even few seconds later the left side of the aircraft dipped down and remained down. I immediately called for and took control of the aircraft whilst assessing the situation, looking both left and right, noticing the left wing down and right wing up. This quick reaction happened (which seemed) all within a few milliseconds. Noticing the aircraft not being levelled and hearing a muffled scrapping noise, I immediately pulled the fuel mixture back to cut fuel flow, which essentially stopped the engine/propeller from operating (we had been on idle power on landing and roll-out). I then turned the ignition/key off all while maintaining aircraft control with right rudder as we were now scrapping/sliding/veering to the left side of runway 18 centerline. Upon coming to a full stop, I immediately opened the door, asked the student if he was "ok" (for which he replied he was fine) and radioed the airport tower stating we needed assistance and possible tow off the runway. I got out of the aircraft to assess the incident, as I walked around the front right to the front left of the aircraft I noticed the wing was sitting atop the wheel assembly and wheel pants. Upon further inspecting the aircraft I also noticed at this time that the strut had completely collapsed and sheared off the wing. There were hardly any debris with the exception of the strut service/inspection cover (a circular panel the size of a half dollar) and a few pieces/shards of fiber glass. I went back to radio the tower but instead I called them directly via cellphone and informed them that we can't be towed and the aircraft was disabled and needed assistance from our FBO. I was asked if we needed emergency services for which I replied that we didn't. First on the scene was the Flight School/aircraft owner followed by the FBO manager, airport manager, local maintenance shop owner/manager and fire department (to provide flood lighting). Aircraft was removed from the runway around 2330 and stored in a airport owned hangar.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

It could not have been prevented due to the gear collapsing was not the fault of the pilot. Weak structural integrity
