Happy Friday Mike,

This is in response to the additional questions on NTSB Request 21-292. Please see attached documents.

Have a great day.

AJW-1441 responses in blue

1 - Request latitude/longitude for each LAN LLWAS-RS remote station and their pole (anemometer) heights.

Stn	Latitude			Longitude			Height ft
	dd	mm	ss.ss	dd	mm	ss.ss	
1	42	46	21.94	84	35	13.09	80
2	42	47	1.97	84	34	10.50	90
3	42	46	5.50	84	34	14.50	120
4	42	46	6.50	84	32	53.50	120
5	42	46	23.61	84	36	50.36	120
6	42	47	12.03	84	36	9.31	120

2 - Please confirm that the "CF" in the "KLAN 08-24-2021 2230-2315 UTC - Wind Data.txt" file is identical to the "AW" in the "KLAN 08-24-2021 2230-2315 UTC - RBDT Data.txt" file for a given time. If not, what are the differences in those parameters?

In 2000 the terminology in LLWAS changed from Centerfield Wind (CF) to Airport Wind (AW). While all Air Traffic displays now reflect AW, legacy archive software continues to label as CF. There is no difference in the parameters.

3 – Are there any additional sources of wind information (additional anemometers) at LAN that provide data to the LAN ATCT aside from the LLWAS remote stations and the ASOS? If so, what is the equipment and what are the latitude/longitude coordinates?

AJW-1441 is not aware of any additional wind sources at LAN.

4 – Below is an example of windshear alerts sent to the LAN ribbon displays. It identifies WSAs with 20 knot gains at both one mile off 28L approach and 1 mile off 10R departure (the same location). With respect to what directions are the 20 knot gains? If it is the direction of approach or departure (two opposite directions at the same location), how can there be a 20 knot gain at the same location with respect to travel in two opposite directions? What is the logic in determining gains/losses for a particular location that can be identified as both an approach end and a departure end? We would have thought that, for example, an aircraft on approach to 28L would be advised of a 20 knot gain, whereas an aircraft on departure from 10R (same location) would be advised of a 20 knot loss in the same event. I am sure we are missing something, and I am assuming the system does not know what runways are in use at any moment. Thank you for any help.

Subject: NTSB Request 21-292 Follow-up

[CAUTION] This email originated from outside of the organization. Do not click any links or open attachments unless you recognize the sender and know the content is safe.

Good morning Mike,

This is in response to the additional information you wanted on weather data. Please see response below.

A LLWAS Tech person looked into the time difference noted by NTSB on the LLWAS data. On September 9, it was confirmed by looking at the LLWAS maintenance screen that the system was not receiving GPS time updates from the Digital Audio Legal Recorders (DALR). Informal comparisons between the time on the DALR and the LLWAS-RS revealed that at the time the LLWAS-RS was approximately 5 minutes and 50 seconds behind the DALR. It is not possible to determine the exact amount of time lag in the LLWAS-RS at the time of the aircraft incident in Lansing, MI on August 24.

Have a great day.

Subject: NTSB Request 21-292

[CAUTION] This email originated from outside of the organization. Do not click any links or open attachments unless you recognize the sender and know the content is safe.

Good morning Mike,

This is in response to NTSB Request 21-292.

The first attached file (KLAN 08-24-2021 2230-2315 UTC - Wind Data.txt) contains individual wind data from each remote station of the LLWAS-RS during the time requested. The wind data is archived in 10-second increments (scans). The wind speeds listed in the file are in knots and the wind direction is magnetic. The times listed in the spreadsheet are all UTC. "CF" is the two-minute average wind speed and direction, as well as, any gusts calculated from the Airport Wind remote station readings. In the case of LAN, the primary Airport Wind remote station is Remote Station #1. RS is an abbreviation for Remote Station. In the file, any missing data is coded with a "999 99". A value of "G00" in the airport wind reading represents no current wind gust detected.

The second attached file (KLAN 08-24-2021 2230-2315 UTC - RBDT Data.txt) contains the windshear algorithm output data provided by the LLWAS-RS to displays in the Air Traffic Control Tower (ATCT) during the time requested in 10-second increments (scans).

Have a good one.

Anne
