

Jason Aguilera
Senior Air Safety Investigator
Aviation Safety - Central Region

Subject: CEN21LA396

An autopsy was conducted on the pilot by the Office of the Chief Medical Examiner, Tulsa, Oklahoma. The cause of death was multiple blunt force injuries, and the manner of death was ruled an accident. The medical examiner noted that the pilot had been transported to a local hospital where he received extensive medical intervention prior to succumbing to injuries.

Toxicology results were positive for the presence of etomidate which is an intravenous short-acting barbiturate used for general anesthesia. Etomidate was most likely administered as part of acute medical care provided after the accident.
