NARRATIVE HISTORY OF FLIGHT (Please type or print in ink)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

In flight prior to accident flew from KCEU to return home to KOZW on 9/6/21. Filled up in KCEU at self-fill station. En-route stopped at KSGH. FBO was closed at Springfield due to labor day so did not obtain fuel. Continued home to OZW. Total flight time was 3 hours for first leg @ 10,000ft and 1.5 for second leg @ 8,000ft. The date of accident was going to fly aircraft to KPTK for maintenance (oil change, some squawks). Prior to takeoff, using a rough calculation of 10gal/hour of fuel burn for XC flying estimated that 49 gallons usable remained on-board (after the accident and followed more detailed fuel consumption estimate and came up with likely 42 gallons used on XC flight). Before T/O checked Shadin fuel flow gauge which read 30 gallons remaining, and fuel level gauges read 1/2 left tank and 3/4 right tank and so used right tank for T/O and operations.

Plan for flight was to take-off, fly to KTEW (20 nm) get fuel and do some touch-and-go's before proceeding to KPTK. Shortly after take-off engine began to run rough for a few seconds. I turned north and leveled out to get out of the pattern and focus on checking all my gauges which seemed nominal I after engine power returned so turned towards KTEW. En-route I had second thoughts about causes of engine roughness (believing I had enough fuel in both tanks, I thought I was having an engine issue) and decided to bypass landing and turn back to PTK.

Reached 4500 for cruise, began to lean, that's when I lost engine power. Believed I was within gliding distance of OZW at this point and proceeded on course while trying to trouble shoot lost engine power. I was over-focused with the engine and didn't realize my AP was still engaged in ALT mode trying to maintain altitude. By the time I noticed how slow I'd gotten I'd probably lost about 500-1000 ft at sub-optimal gliding speeds. It all happened faster than I thought and did not think to follow the full checklist for engine out. Realized about 1500 agl I was not going to make OZW. The highway was not a good choice due to rush hour, and the test track to the south seemed a little too far away so chose corn field in front of me I knew I had made. Extended gear and flaps, and made a short lateral turn to field to dissipate some altitude and energy to ensure I had the field made. Managed to open door before landing. Corn provided a relatively non-violent deceleration. Shut off fuel and power to plane and exited plane before contacting emergency services

After the crash the tanks of the plane were drained and no fuel remained in the right tank (that indicated 3/4 on takeoff) and only 6.5 remained in the left tank, fuel exhaustion being the cause of accident. On the ground after fuel had been exhausted from right tank, right fuel gauge still read 1/2 full.

RECOMMENDATION (How could this accident/incident have been prevented?)**Operator/Owner Safety Recommendation**

A few points of improvement to prevent a similar accident occurring:

- Practice following emergency procedure, memorize engine out procedure. Emergency procedures were not reviewed during insurance check out. Possibly post emergency procedures in cockpit instead of having to hunt it down in a procedure leaflet.
- Verify actual fuel capacity. According to logs fuel capacity was last verified in 2006, as part of purchase it would be worthwhile to drain and measure each tank capacity. I had never flown the aircraft below 1/2 fuel capacity until this point in ownership so didn't know how gauges would respond or if any shifts in bladders had reduced fuel capacity below placarded amount. If at any other point I'd flown close to VFR minimum fuel requirements on a XC flight I would have exhausted fuel.
- Develop more comprehensive filling procedure. After some online research it seems that there is some burping to get air bubbles out of tanks on fueling Mooneys to reach full capacity. During check out this wasn't done, the tanks were filled and fuel set as 'full' on Fuel Flow monitor. Also, during check out, was instructed that the Fuel Flow meter was accurate enough to trust generally how much fuel was remaining onboard.
- Take the time to either fill up after every flight > 2 hrs
- Reduce any future aircraft range by 1/2 until fuel capacity can be verified

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)

Was there Mechanical Malfunction/Failure? ☒ Yes ☒ No
(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)
