

NATIONAL TRANSPORTATION SAFETY BOARD

NTSB Form 6120.1

PILOT/OPERATOR AIRCRAFT ACCIDENT/INCIDENT REPORT

Email the pilot/operator aircraft accident/incident report to the investigator-in-charge of your accident/incident. If email is not available, mail the report per the instructions below.

If your accident/incident occurred in Maine, Vermont, New Hampshire, Massachusetts, Connecticut, Rhode Island, New York, New Jersey, Pennsylvania, Maryland, Delaware, Virginia, West Virginia, Kentucky, Tennessee, North Carolina, South Carolina, Mississippi, Alabama, Georgia, Florida, the District of Columbia, Puerto Rico, or the US Virgin Islands, send the form to: NTSB, ERA, 45065 Riverside Parkway, Ashburn, VA 20147.

If your accident/incident occurred in Ohio, Michigan, Indiana, Wisconsin, Illinois, Minnesota, Iowa, Missouri, Arkansas, Louisiana, North Dakota, South Dakota, Nebraska, Kansas, Oklahoma, Texas, Colorado, or New Mexico, send the form to: NTSB, CEN, 4760 Oakland Street, Suite 500, Denver, CO 80239.

If your accident/incident occurred in Montana, Wyoming, Idaho, Utah, Arizona, Nevada, Washington, Oregon, California, Hawaii, or the territories of Guam or American Samoa, send the form to: NTSB, WPR, 505 South 336th Street, Suite 540, Federal Way, WA 98003.

If your accident/incident occurred in Alaska, send the form to: NTSB, ANC, 222 West 7th Avenue, Room 216, Box 11, Anchorage, AK 99513.

Rules pertaining to notification of aircraft accidents and incidents, as well as overdue aircraft are found in 49 Code of Federal Regulations (CFR) Part 830 http://www.ecfr.gov/cgi-bin/text-idx?c=ecfr&tpl=/ecfrbrowse/Title49/49cfr830_main_02.tpl. These rules state the authority of the NTSB, define accidents, incidents, injuries, and other terms, and provide procedures for initial and immediate notification of accidents and incidents by aircraft pilots/operators.

A. APPLICABILITY

The pilot/operator of an aircraft shall send a report to the office listed above, based on accident/incident location; immediate notification is required by 49 CFR 830.5(a). **The report shall be filed within 10 days after an accident for which notification is required by Section 830.5, or after 7 days if an overdue aircraft is still missing.**

An aircraft accident, as defined in 49 CFR 830.2, is determined as an occurrence that involves a fatality or serious injury, or substantial damage to the aircraft. For occurrences that do not involve a fatality, the determination that the occurrence is an accident can be appealed by writing to the Director, Office of Aviation Safety, NTSB, 490 L'Enfant Plaza, S.W., Washington, D.C. 20594.

INSTRUCTIONS TO PILOTS/OPERATORS FOR COMPLETING THIS FORM

It is necessary that ALL questions on this report be answered completely and accurately.

If more space is needed, continue on a blank sheet of paper.

Nearest City/Place: Use the name of the nearest community in the state where the accident/incident occurred.

Date/Time: Indicate the date and local time of the event. Be sure to indicate the time zone.

Phase of Operation: Indicate the phase of operation during which the accident/incident occurred.

Aircraft Information: Enter aircraft make and model information as indicated on the aircraft registration certificate, including series. If the involved aircraft is certified as "amateur-built," include the name of the producer of the kit or plans, unless an NTSB employee instructs otherwise.

Maximum Gross Weight: Enter the certificated maximum gross weight for the aircraft involved in the occurrence. This should be the same as the maximum gross weight indicated on the aircraft weight and balance documents.

Engine: Enter engine make and model information as indicated on the engine data plate.

The NTSB uses this form for aircraft accident prevention activities and for statistical purposes. NTSB regulations (49 CFR Part 830) require that **ALL** questions be answered completely and accurately. Completion of this form will take approximately 60 minutes. The NTSB does not guarantee the privacy of any information provided in this form. You need not complete this form unless it displays a valid OMB control number, in accordance with 5 C.F.R. § 1320.5(b), which applies to this collection of information.

B. DEFINITIONS

1. "Aircraft Accident" means an occurrence associated with the operation of an aircraft that takes place between the time any person boards the aircraft with the intention of flight and all such persons have disembarked, and in which any person suffers death, or serious injury, or in which the aircraft receives substantial damage. For purposes of this form, the definition of "aircraft accident" includes "unmanned aircraft accident," as defined at 49 CFR 830.2.

2. "Substantial Damage" means damage or failure that adversely affects the structural strength, performance or flight characteristics of the aircraft, and that would normally require major repair or replacement of the affected component. NOTE: Engine failure or damage limited to an engine if only one engine fails or is damaged, bent fairing or cowling, dented skin, small puncture holes in the skin or fabric, ground damage to rotor or propeller blades, and damage to landing gear, wheels, tires, flaps, engine accessories, brakes, or wing tips are not considered "substantial damage" for purposes of this report.

3. "Operator" means any person who causes or authorizes the operation of an aircraft, such as the owner, lessee, or bailee of an aircraft.

4. "Fatal Injury" means any injury that results in death within thirty (30) days of the accident.

5. "Serious Injury" means any injury that (1) requires hospitalization for more than 48 hours, commencing within 7 days from the date the injury was received; (2) results in a fracture of any bone (except simple fracture of fingers, toes, or nose); (3) causes severe hemorrhages, nerve, muscle, or tendon damage; (4) involves injury to any internal organ; or (5) involves second- or third-degree burns, or any burns affecting more than 5 percent of the body surface.

Type of Fire Extinguishing System: If a fire extinguishing system was used to fight an aircraft fire, specify the type(s) of extinguishing system(s) used. Examples include handheld extinguisher, engine fire bottle, cargo/baggage compartment fire suppression system, or airport emergency ground equipment.

Owner/Operator Information: Enter the owner information as shown on the registration certificate. Commercial operators, enter the operator information, including "doing business as" when applicable, as shown on the operator certificate.

Revenue Sightseeing Flight: Indicate whether the accident aircraft was conducting revenue sightseeing operations under 14 CFR Part 91 at the time of the accident.

Air Medical Flight: Indicate whether the accident flight was being conducted for the purpose of carrying medical personnel, patient(s), or organs.

Public Aircraft: Federal, state or local government flight operations such as official travel, law-enforcement, low-level observation, aerial application, firefighting, search and rescue, biological or geological resource management, or aeronautical research. Indicate whether the flight was conducted by the armed forces, federal, state, or local government.

Purpose of Flight: 14 CFR Parts 91, 103, 133, 136, and 137: Indicate the type of operation that was being conducted at the time of the occurrence using the following definitions:

AERIAL APPLICATION--Operations using an aircraft to perform aerial application or dispersion of any substance. Examples include agricultural, health, forestry, cloud seeding, firefighting, insect control, etc.

AERIAL OBSERVATION--These flights include aerial mapping/photography, patrol, search and rescue, hunting, highway traffic advisory, ranching, surveillance, oil and mineral exploration, criminal pursuit, fish spotting, etc.

AIR DROP--Aerial operations, other than aerial application, that are intended to release items in flight.

AIR RACE/SHOW--Includes any flight operations conducted as part of an organized air race or public demonstration.

BUSINESS--includes all personal flying without a paid professional crew for reasons associated with furthering a business, including transportation to and from business meetings or work. This does not include corporate/executive operations, air taxi, or commuter operations.

EXECUTIVE/CORPORATE--Company flying with a paid, professional crew.

FERRY--Non-revenue flight under a special flight or "ferry" permit. Refer to 14 CFR 21.197 for details of special flight permit issuance.

FLIGHT TEST--Flight for the purpose of investigating the flight characteristics of an aircraft/aircraft component or evaluating an applicant for a pilot certificate or rating.

INSTRUCTIONAL--Flying while under the supervision of a flight instructor or receiving air carrier training. Personal proficiency flight operations and personal flight reviews, as required by federal air regulations, are excluded.

OTHER WORK USE--Miscellaneous flight operations conducted for compensation or hire such as construction work (not 14 CFR Part 135 operation), parachuting, aerial advertising, towing gliders, etc.

PERSONAL--Flying for personal reasons (excludes business transportation) including pleasure or personal transportation. This also includes practice or proficiency flights performed under flight instructor supervision and not part of an approved flight training program.

POSITIONING--Non-revenue flight conducted for the primary purpose of relocating the aircraft. Examples include moving the aircraft to a maintenance facility or to load passengers or cargo etc.

UNKNOWN--Use only if the primary purpose of flight is not known.

Other Aircraft--Collision: For all accidents involving a collision with another aircraft, including parked aircraft, check "Collision with other aircraft" under Basic Information and complete this section indicating details about the OTHER aircraft involved in the collision.

Airport Information: Complete this section if the accident/incident occurred on approach, landing, takeoff, departure, or within 3 statute miles of an airport. Please refer to the FAA Airport/Facility Directory or other official source for airport information.

Airport Identifier: Provide the official 3 or 4 character airport identifier number.

Runway: Indicate the number of the runway used, including L, R, or C if applicable.

Runway/Landing Surface: Indicate the type of intended runway/landing surface (do not indicate surface conditions). If the surface type was mixed, check all that apply.

Condition of Runway/Landing Surface: Indicate the condition of the intended runway/landing surface. If multiple conditions existed at the time of the accident, check all that apply.

Weather Information at the Accident/Incident Site: Indicate the weather conditions reported at the accident/incident site at the time of occurrence. If no weather reporting was available for the accident/incident site, indicate the reported conditions at the nearest reporting site. Specify the weather reporting site identifier, the observation time, and distance from the accident/incident.

Sky/Lowest Cloud Condition: Indicate the height above ground level of the lowest cloud condition present at the time of the accident/incident and whether coverage was reported as few, scattered, broken or overcast. Also indicate the height above ground level and coverage of the lowest cloud ceiling present at the time of the accident/incident (reported as broken or overcast).

NOTAMs (D and FDC), AIRMETs, SIGMETs, PIREPs: Describe all NOTAMs (distant (D) or Flight Data Center (FDC), if known), AIRMETs, SIGMETs, and PIREPs in effect near the accident/incident.

Flight Crewmember Information: Indicate the category that best describes the capacity served by this flight crewmember at the time of the accident. The designators "Flight Crewmember 1" and "Flight Crewmember 2" do not refer to a specific pilot position or responsibility. If more than one pilot is aboard, they may be entered in any order and their capacity entered as appropriate.

Degree of Injury: See Definitions on the top half of Page 1 of the instructions. Minor injury is not defined. If an injury does not meet the criteria for another injury category, select Minor.

Date of Last Flight Review or Equivalent: Enter the date of the most recent flight review, or equivalent, completed by this pilot. Refer to 14 CFR 61.56 for accepted equivalents.

Type Ratings: List all type ratings on the pilot certificate. If the pilot holds no type ratings indicate "none." If the pilot holds a pilot certificate other than student and was flying an aircraft requiring an endorsement, enter the type and date of any logbook endorsement(s) for that aircraft. See 14 CFR 61 for examples of required endorsements.

Student Endorsements: If the pilot holds a student pilot certificate, enter all solo endorsements and dates on the student pilot certificate.

Flight Time: Complete the flight time matrix. Solo flight time should be included as "Pilot-in-Command (PIC)" and all dual flight instruction given should be included as "Time as Instructor."

Additional Flight Crewmembers: Complete this section if there were more than two required flight crewmembers on the aircraft. This also includes a check airman performing official duties but does not include cabin crew. State the capacity served by each included crewmember at the time of the accident.

Passenger(s)/Other Personnel: Enter identification and injury severity information for all passengers, cabin crew, and other personnel involved in the accident. See Page 1 of the instructions for the official definition of injury levels.

Several questions throughout the form allow for multiple responses; when appropriate, choose all responses that apply.

These instructions only pertain to major issue areas covered by NTSB Form 6120.1 Pilot/Operator Aircraft Accident/Incident Report. For additional definitions of questions and responses, please refer to www.nts.gov.

Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Propellers - 2.5 of were broken off, Windscreen was broken, Fixed wheels were detached from plane, wings were dented with at least one fracture at fuselage, fuselage appeared to have been damaged, parachute was utilized resulting in damage during deployment, damage to elevators, ailerons, and tail.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

A trip was planned to originate from Indianapolis Executive Airport in Zionsville, Indiana on Thursday, February 10, 2022 with the final destination being Grand Junction Regional Airport in Grand Junction, Colorado. The trip was planned with a fuel stop and overnight stay in Lincoln, Nebraska. An IFR flight plan was filed departing TYQ and flying direct to LNK at 10,000 feet MSL.

The weather briefing for this trip was obtained from Foreflight prior to heading to the airport. I arrived at the airport around 1715 hours, Eastern Time, and began my pre-flight inspection of the aircraft. The fuel had been topped off the day before by First Wing Jet Center, giving me 92 gallons of 100LL Avgas. The deicing system was also topped off with TKS earlier in the week and remained full of approximately four (4) gallons on each side. The oil was approximately six (6) quarts, so one (1) quart of Phillips 66 X/C Aviation 20W-50 oil to the engine. The onboard Jeppesen Charts were also updated during my preflight inspection.

After loading the plane with items being transported on this trip, a brief overview of the trip was discussed with my passenger, Mark Helms. The plane was removed from the hanger and placed onto the apron in preparation for our departure. The engine was started without incident and the gauges were reading appropriate after being started. The flight details were programmed into the MFD and the local weather was obtained from the AWOS at the Indianapolis Executive airport. As we taxied from the apron toward the ramp, the flight controls were checked for proper response and free movement. Prior to entering the taxi way, a runup was conducted with no issues noted. All my pre-flight checklists were completed prior to departing TYQ.

I departed TYQ at approximately 1740 hours utilizing runway 18. After reaching an appropriate altitude, a turn to the west was initiated and I began flying an on-course heading of approximately 280 degrees. My climb was set to a cruise climb of approximately 120 knots and the autopilot was engaged. I picked up my IFR clearance in the air, shortly after departing TYQ. I was cleared to LNK via Direct with my final altitude being 10,000 feet MSL. After reaching my final altitude and a cruising speed of approximately 150 knots, the manifold pressure was reduced to approximately 30.5 inches and the fuel mixture was adjusted lean of peak to approximately 18.2 gph.

The flight was uneventful and the plane was running appropriately, with all gauges noted to be within the proper operating limits. Approximately 60 NM east of LNK, there was a brief stutter of the engine and the plane began running rough. A check of my instruments indicated that my engine speed was maintaining at approximately 2480 rpm and my fuel flow was approximately 18.4 gph. My oil pressure was maintaining in the low to mid 50's psi and my oil temperature was around 180 degrees. I noticed that the cylinder head temperature on cylinder 3 was much lower than the other five (5) cylinders; however, it remained in the green on the gauge. My airspeed was also maintaining in the 140s KTS.

Shortly after the rough running was noticed, we entered an area of moderate snow with an outside air temperature of approximately -5 degrees Celsius. I noticed some light rime ice beginning to form on the leading edge of both wings. The deicing system was activated and shortly thereafter, the icing began to flake off the wings. After noticing my indicated airspeed begin to decrease into the 130s KTS, I began researching alternate landing sites and selected KPMV as a possibility.

I advised Omaha Approach that my engine was running rough and asked to divert to KPMV. I was given a clearance direct to PMV and to descend and maintain 4,000 feet. I began a decent rate of approximately 500 feet per minute and turned to fly direct to PMV. I also began going through my emergency checklists with regards to the engine failure during my descent. As I passed approximately 9,000 feet MSL, I noted the icing was gone from the leading edges of my wings and we were no longer in the snow or any type of precipitation. As I descended just below 8,000 feet MSL, the engine began to run smooth and my indicated air speed began increasing back into the 140s KTS. I was approximately 40 NM east of LNK when this occurred. I advised Omaha approach that my engine had smoothed out and that I would like to continue to my original destination of LNK at 6,000 feet if possible. I was cleared direct to LNK and to maintain 6,000 feet. As I began flying back toward LNK, I noticed the cylinder head temperature for cylinder 3 was zero.

(Continued in Additional Information)

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

This aircraft was used often, putting 1000 hours on it in 3 years since manufactured. It has a spinner to tail warranty for 5yrs / 2000 hours. This may have give a false sense of security with regards to potential failures.

With Hindsight Bias, we will now perform additional inspections to possibly catch such a failure on the ground. In 2021, a 100 hour inspection (not required) was performed due to high use. This caught a bad cylinder which was replaced (#5.) Had such an inspection been required/performed, this may have caught this defect. It will be our policy going forward.

Additionally, there is a very large number of cylinder replacements on this model engine. I recently received a letter from a Cirrus Owner collecting data on the issue. With a TBO of 2000, he had to have his engine overhauled at 800 hours. Does this engine truly have a 2000 TBO, or is that just an arbitrary value. A rental airplane at our airport had a failure while in the pattern and was able to land safely. How common is this and can we do something in maintenance or in practice to help prevent this.

When encountering a potential engine failure, we have a human factors response of wanting to get to the ground. This requires a descent as well as power changes. This can exacerbate the problem. Potentially train pilots to declare an emergency and remain at altitude to the destination. Then once over destination perform a descent over the airport within glide. In this situation, it may or may not have worked, an engine tear down may help answer this question. Current Cirrus teaching guide a pilot to pull the chute and pull it early.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)

Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

NTSB and FAA have retained the aircraft for analysis. Preliminarily, we believe there was a catastrophic engine failure that may have started with cylinder #3. This has confirmation evidence with the oil coating the belly of the airplane as well as the HAZMAT release in the field.

EVACUATION OF AIRCRAFT

Was an emergency evacuation of the aircraft performed? ☒ Yes ☐ No

Method of Exit – Describe how the occupants exited and how many occupants evacuated each location

Opened doors and both occupants exited through the open doors.

A National Guard Blackhawk was nearby and heard the radio call. Armed with night-vision, they immediately located the aircraft, landed within minutes of our aircraft, rendered aid and contacted the authorities.

ADDITIONAL INFORMATION (Please type or print in ink)

Use this space if additional space is needed for any answers.

As I traveled to LNK at 6,000, I was handed off to another approach controller for Omaha. Approximately 15 NM east of LNK, the engine again began to run rough again so I asked the approach controller if I could start a slow descent into LNK. I confirmed with the controller that I had the current ATIS, which was information Xray. I was given clearance to descend and maintain 3,000 feet MSL. Approximately 13 NM east of the field, Omaha approach told me the field was approximately 12 o'clock and to advise when in sight. Approximately 12 NM east of the field, I reported the field was in sight to Omaha control and was given a clearance for the visual to runway 17. Shortly thereafter, I was handed off to Lincoln tower.

After checking in with Lincoln tower, I was cleared to land on runway 17. I continued my descent and around approximately 2,500 feet MSL, the engine began to run very rough and my oil pressure began to rapidly decrease along with my indicated airspeed. After evaluating the distance to the runway, along with the strong headwinds I was facing and the status of my engine, I determined that I was unable to safely travel over the populated area and make a landing at the airport. I was approximately 6 NM to the east of LNK when I notified Lincoln tower that I would not be able to make the runway and that I was going to look for an open area or field to land in. I immediately turned the plane toward the southeast to head away from the populated area and look for a field. After finding a field, I deployed the parachute and pulled my fuel cutoff. An emergency landing was made in a harvested cornfield. After landing in the harvested field, I continued the process to shut the power down to the plane and we immediately evacuated the aircraft.

I HEREBY CERTIFY THAT THE ABOVE INFORMATION IS COMPLETE AND ACCURATE TO THE BEST OF MY KNOWLEDGE
