Description of Damage to Aircraft and Other Property <i>(Use additional sheet if necessary)</i> Damage to outboard right wing leading edge due to impact with mesquite bushes. No damage to property.					
NARRATIVE HISTORY OF FLIGHT <i>(Please type or print in ink)</i>					
Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.					
We were testing the anti-skid braking system on dirt, using runway 7/25 located at Fort Stockton-Pecos County Airport in Texas. Initial takeoff for this series of conditions was at 2020Z, weight was 16,300 lbs. We completed 3 landings to full stops, both engines operating, with maximum braking using landing flaps at maximum landing weight. Takeoffs were on runway 30 (paved), with landings on runway 25 (dirt). After each landing, we taxied to the ground crew, located on dirt runway 16/34, to record brake temperatures and cool the brakes. Landing performance was good with no degradation of directional control. For this condition, the left engine had been shut down and secured on downwind. The PF intercepted a 3 degree glide path and aligned the aircraft on final approach. Per the test procedure, the PF brought the power levers to idle at 50' and touched down with a sink rate of about 300 fpm. Power levers were then moved to ground fine and maximum braking was applied. Initial deceleration seemed to be less than the previous 3 runs. The airplane moved slightly to the right at first, then started moving more toward the right side of the runway in a noticeable skid. The aircraft drifted toward the right, until finally paralleling the right edge of the runway with the wingtip overhanging the edge. We both felt a bump as the right wingtip went through some taller shrubs on the right side. The right main gear never departed the runway. Finally, the aircraft was brought away from the right edge and back to the center of the runway as the airplane slowed and stopped. We re-started the left engine and taxied to the ground crew. After they completed an initial look at the right wing damage and measured brake temperatures, we taxied back to the ramp and shut down the aircraft.					

RECOMMENDATION (How could this accident/incident have been prevented?)**Operator/Owner Safety Recommendation**

1. Conduct testing on a wider runway, or at least have wing clearance at the runway edges.
2. Provide clearer monitoring of the ABS status.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)**Was there Mechanical Malfunction/Failure?** ☒ Yes ☐ No*(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)*

Post-flight inspection of the runway indicated wheel skids on portions of the dirt. It seemed that the anti-skid brakes were ineffective in preventing the main gear tires from skidding. Determining if the anti-lock brake system was functioning properly may require further investigation.

Ground personnel were monitoring wind data from a sensor near the runway midpoint. Wind from that sensor at the time of the event was reported as 010/10. Upon review of the wind station data post flight, the wind was variable between 352-027 degrees between 6-10 knots.
