Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Keel of the hull is cracked and the keel strip is destroyed and removed. Right main gear separated from underneath the wings. Right wing pontoon separated after ground impact. Bottom of the right wing skin removed from the outer 1/4 of the wing. Canopy is cracked near the engine mount, and the shape of the canopy is deformed and the plexiglass windscreen cannot close.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Refueling was not done that day. Refueling took place after a flight a week prior. The fuel tanks were each about half full, 13 gallons over all with ~6 gallons in each tank. Fuel sump revealed no contaminants.

Prepared the airplane for a short demonstration flight with a potential buyer. Run up was ok and we proceeded to Runway 16 for takeoff. Engine was ok during initial takeoff roll. Shortly after rotation the engine sounded quieter and the RPMs were fluctuating 2600 is normal, but the needle was wiggling between 23 and 2500 RPM. I retracted the landing gear. This helped the climb a little, but the engine power was continuing to deteriorate. No engine roughness was felt at this point. The airplane was placed at best angle for climb pitch attitude, about 70 mph.

By the time the aircraft cleared the 35' trees at the end of the runway the RPMs were now down to about 21 to 2300 RPM. Some engine roughness was felt. A combination of slightly rising terrain and an inability to maintain a climb precluded the continuance of the flight and the least undesirable field option was selected directly ahead. The aircraft was maneuvered from its 150° heading to about a 100° to avoid a treeline south of the airport.

Mixture was leaned to shutoff and the throttle closed. The airplane touched down hard [see description of damage] with the engine stopped. My Osprey flares at about 55 mph normally but I didn't note the speed at this particular touchdown. My passenger reported no injuries and left the scene.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

The baffles in the fuel tanks of the Osprey II prevented me and the mechanics that performed the conditional inspection from seeing the debris, FOD, or possible corrosion that had built up in the fuel tank. Even if the FOD was detected, cleaning the fuel tanks would have required removing them, and this would essentially require destroying the wings. It's my wish that all future Osprey builders consider the access to the fuel tanks when designing and building this part of their aircraft.
