Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Impact damage to all aircraft components.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I took off from Lansing airport at approximately 3:06 pm local time and proceeded southwest around Bult field.

At approximately 3,000 MSL I was conducting idle power off full stalls/recoveries. The first three stalls and recoveries were unremarkable. On the fourth stall when the stall break occurred the aircraft snapped to the left and rolled inverted (this was the first time the aircraft rolled to the left after the stall break). I was initially hanging from the seat belts while the aircraft was inverted. The aircraft continued to roll left and settled into an upright left spin with a relatively flat nose down pitch attitude between 10-20 degrees. The rate of spin rotation was very high and seemed to be increasing in rate. The spin rotation along with the nose down pitch attitude resulted in my body being pushed forward into the shoulder harnesses and lap belt. The first control input of full right rudder did nothing to slow or arrest the spin rotation. Neutral elevator and aileron along with full right rudder did not stop the spin rotation. Neutral ailerons, full down elevator and full right rudder did not break the stall or stop the spin rotation. The last thing I remember trying to stop the spin was applying full throttle, again the aircraft showed no tendency of recovering from the left spin. The aircraft rotated about six 360-degree rotations after the aircraft departed controlled flight.

I saw the approaching terrain in my peripheral vision. I do not remember the impact with the terrain.

The next thing I remembered when I regained consciousness was numerous emergency response personnel coming to my aid and working to extract me from the aircraft.

My most severe injury is my right leg Tibia which has a multiple compound fracture. I believe my right leg injury was a result of the right rudder input I had when the aircraft impacted the terrain.

Thinking back about the fourth power off stall the deceleration rate was greater than the previous three stalls and the pitch attitude was greater than the previous three stalls. It was not a whip stall but the deceleration rate along with the higher pitch attitude seems to have resulted in a left outboard wing stall causing the departure from controlled flight and the left spin entry.

Before the aircraft departed controlled flight, I'm not aware of any aircraft malfunctions.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

All home built aircraft are unique and will therefore have different stall spin characteristics.

I would not conduct full stalls/departures in a home built aircraft.

At the first sign of an aerodynamic stall I would initiate a recovery.
