Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Rt. wing, first 30in. crushed. Wing tip crushed and cracked. Rt. flap Lt. lower corner bent up from wing torque. Lower nose bowl cracked. , spinner bulkhead destroyed, spinner destroyed, nose landing gear severely bent, firewall bent, fuselage floor and stiffeners between firewall and main gear bent.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and and location, services obtained, and intended destination. Provide as much detail as possible.

After a thorough walk around and engine check, we left 44M to the south on a personal flight at approx. 9:15CDT. I was piloting the plane, weather was clear, and wind out of the north west at about ten mph at 3200 ft msl. The engine was running smoothly at 25in. manifold pressure and 2950rpm(normal cruise for the engine). My wife was flying as safety pilot. I was adjusting the parameters on the autopilot . About 45 minutes into the flight, the engine stuttered and then started to run roughly. I turned the autopilot off and my wife input nearest and then direct in the gps. I turned towards the airport. We had a course marked but not a visual on the airport. The airport was across a lake and in trees. Within two or three minutes the engine started running rougher and rougher. Engine power was falling rapidly and I could no longer maintain altitude. We had dropped to 2500ft I did not believe we could make the airport. We located a field that appeared appropriate for an off airport landing. I proceeded to make a relatively normal decent to land into the wind slipping the plane to lose altitude. Because of our rather high approach, my airspeed was about 10mph higher than normal. The approach end had trees and I was concerned about slowing down too much and under shooting the approach. The engine quit about 50ft. above the ground. The round out and landing were normal except we had extra speed. The field had large bumps that caused us to become air born and we skipped several times. After using up 2/3 of the available landing distance, I was firmly on the ground and applying the brakes. There was only about 300 feet left. There was a five strand barbed wire cattle fence at the end of the field. Our aircraft has a tip up canopy that can trap passengers inside if the plane goes over on it's back. So I decided to try a hard turn rather than chance going over by hitting the fence. I made a hard left skidding turn. We were slowed down substantially but the nose gear dropped into a hole and the nose wheel collapsed. The right wing hit the ground and the plane pitched up on its nose and stopped. Neither of us were hurt. We shut down the systems and we got out of the plane. Fuel was draining out of the right wing tank vent tube. We pulled the tail down and got the plane back up on its bent nose gear. The leak stopped. There were no more issues with the plane. My wife went to find a phone and to call help and I stayed with the plane. I got the gps coordinates from one of our secondary handheld gps and shut off the ELT since we had not been injured. There was no damage to anyone else's property. Our intent had been to return to 44M after finishing the auto pilot adjustments. The off field landing occurred at about 10:00AM CDT.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

With an engine quitting because of a unpredictable mechanical failure, you have to make a judgment call on what to do. I believe under the circumstances, I made the right decision. However, I should have gotten the plane slowed down farther before landing. Perhaps I could have avoided damaging the airplane. I just felt it was more important to get us safely to the ground.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

A Cylinder head rocker stud General Motors part and serial numbers unknown. The stud broke at the nut. I do not know if this is primary or secondary damage. I will not know until I tear down the engine
