Description of Damage to Aircraft and Other Property (Use additional sheet if necessary)

propeller, landing gear, spinner, right wing tip (possible spar).

NARRATIVE HISTORY OF FLIGHT (Please type or print in ink)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Take off at m27 12:35 local. Climbed to 5,000' for 1st flight activities, light turns, simulate landing pattern 5,000' to 4,000'. Climbed back to 5,000' to do some stalls. Straight ahead level flight, power back to 1200 RPM, slowly while pulling stick back steadily. No difficulty maintaining heading, barely lost altitude, only a slight mush at 200'/min. descent with stick full back. Recovered and leveled at 5,000', then slowly reduce power to idle while slowly pulling back stick to full. Heading easily maintained, rate of descent increased to 900'/minute, wings easily maintaining level. After 35 min. of flight I returned for landing pattern on runway 27. After such a remarkable stall series I decided to land more slowly and approached at 65 mph ^(30° flaps) reducing speed to about

1. Acquire transition training regardless of your experience or confidence when flying a "new to you" aircraft.
2. Make your first pass a slight touchdown and short roll before going around, and continue this method of approach gradually lengthening the roll out until you are fully confident of the ground handling nuances at higher speeds.
3. Don't allow yourself to be rushed.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)

Is there Mechanical Malfunction/Failure? ☐ Yes ☒ No
If Yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

non-ethanol

Other Services, if Any, Prior to Departure

EVACUATION OF AIRCRAFT

Was an emergency evacuation of the aircraft performed? ☒ Yes ☐ No

Method of Exit – Describe how the occupants exited and how many occupants evacuated each location

Only 1, as pilot, performed emergency egress after securing fuel, elec. power, mixture, mags. Then 4 of us flipped it upright.

OTHER AIRCRAFT – COLLISION (If air or ground collision occurred, complete this section for other aircraft)

60 mph right over the threshold of runway 27. Wind 250° at 4 kts. I was estimated to be 2' above the surface and made a fairly hard touchdown on the main landing gear, tail up. Bouncing back in the air I powered quickly and returned to normal flight without touching the runway as I did a "go around"; retracting flaps after establishing a climb.

On the next pass I again proceeded with 30° flaps and used the same procedure as above. This time as I was over the threshold at 8' agl, I reduced power, bottomed out, bounced high uncontrollably, nosed over, bounced again and spun right while flipping upside down into the grass. Hanging from the harness I kicked the fuel control off mixture, idle cut off, mags off, master power off. Fuel was leaking initially then ceased; I was able to easily release harness and exit the plane unharmed.

I HEREBY CERTIFY THAT THE ABOVE INFORMATION IS COMPLETE AND ACCURATE TO THE BEST OF MY KNOWLEDGE
