NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

October 27th I flew a corporate job to pick up Danny Griffith from Columbus GA. Mr Griffith contracted me to fly a Cessna T210 which he had arranged in order to make the flight(s). The accident flight occurred on the return leg of that trip. I began the day by flying N36X from KFWS to KCSG nonstop. That flight lasted 3.9 hours.
Upon arriving at Flightways FBO at KCSG I requested a fill up with 100LL and observed the Fuel Truck delivering the fuel. I also requested a mechanic to look at the left brake as the pedal felt a little low on the roll out. While I waited on the mechanic I updated the briefing within Foreflight and conducted a self-brief to confirm VFR conditions prevailed along the expected route and destination. Danny paid the fuel bill (67.3 Gallons @ 7.28/Gallon) at that time. I flight planned for 4:00 ETE at 6500 MSL for best winds and consulted the performance chart to ensure we had sufficient reserve.
Once the mechanic added M5606 to the left brake reservoir and reset the brake pedal he released the airplane back to us for flight. During that time Danny (passenger) and I ate a small lunch. I conducted a preflight inspection including visually confirming 9 qts of oil, full fuel tanks and visual inspection of the airframe. We requested flight following and taxied to Rwy 06 where I completed a satisfactory run up and before take-off check list. We departed KCSG at approximately 4:50 EDT with a left turn on route assigned by the tower controller. The climb out and en route portion of the flight was uneventful. I selected an altitude of 6500 MSL (based on the winds aloft forecast predicting headwinds at higher altitudes) and a conservative power setting of 60% rated HP. We started on the right tank and switched to the left fuel tank at the 2:00 hour point of the flight with the intention of using the left tank for 2:00 hours and allowing us to switch back to the right tank prior to entering the pattern for landing. We switched back to the right tank after passing over the Lancaster Airport. We were cleared into DFW Bravo airspace, received ATIS information Alpha just before 8:00 local time, descended to 3500 ft (assigned by ATC) then handed off to CTAF since the Spinks Tower had just closed. We announced our intentions beginning at 10 Miles east of the airport entered left base for 18R where we configured for landing. After turning final and a little above the PAPI (3 white 1 red) glide path indicator I added the last unit of flaps and reduced power to capture the glide path. As I intercepted the glide path I attempted to add power to stabilize the descent and maintain 80kts and discovered that there was no response to the power setting change. I estimate we were ½ mile from the runway threshold and approximately 200AGL. I made sure mixture was full rich then changed the fuel selector valve to the left tank. Again- no response from the engine. With the rapid descent rate at this point and knowing that the field north of the runway was suitable for landing I pitched for approach speed and prepared for soft field landing. The ILS Localizer marker lights let me know that I was near the surface and that the antenna was unavoidable without an excessive pitch up. Once in ground effect I attempted to hold the nose off as long as possible. I felt a slight impact with the antenna then I recall the mains touching down; then the nose briefly followed by the right main collapsing. We began to skid to the right... I applied full left rudder to minimize the turn and keep the airplane from cartwheeling. The airplane came to rest facing north northeast approximately 500ft north and 100 ft west of the approach end of runway 18R.
The terrain north of 18R is generally flat with a major road bordering the airport property and traversing East/West approximately 1 mile from the approach end of the runway. The airport property immediately north is open field that slopes slightly down from north to south.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I am unsure of the reason for engine loss. But, flying a closer in pattern and waiting until short final to apply full flaps would have given me a better margin of safety for an engine out scenario at such a low and slow phase of flight.
