Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

No property damage (other than aircraft). Aircraft received minor (repairable) damage from the landing, including a broken off fuel drain. Draining fuel ignited, causing a fire which could not be extinguished with hand fire extinguishers available onsite. Sustained burning of the fire caused significant damage to aft fuselage and wing center section.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The flight was a short personal flight without ATC services. The route was from Ames, Iowa to Ankeny, Iowa. Departure time was around 10:40 am, and arrival was around 10:53am. This was my third short flight of the morning in the aircraft. The temperature was in the low 60's F, and weather was pleasant with nearly calm winds and unlimited visibility. Approaching Ankeny, I made a normal pattern entry radio call and entered a normal landing pattern. On the downwind leg, I progressed through a normal landing checklist, speaking the steps and confirmations out loud:

Gas - confirm fuel selector on left tank

Undercarriage - confirm below VLE and extend landing gear. Visually confirm gear indicator lights and locking pins engaged (visible through windows on the top of the wing)

Mixture - full rich

Propeller - set to go-around rpms

I announced "Carb heat and flaps to go" and proceeded into the base leg of the turn.

I progressively pulled back the power to sustain a normal glide path and pattern airspeed.

Turning base to final, on determining that I had sufficient altitude to make the runway, I announced "carb heat" and set the carb heat lever to hot. I then announced "flaps down" and intended to move the flap lever to the full down position. However, I believe at this time I grabbed the wrong lever and moved the landing gear lever partially from the full down position. (On observing the position of the lever after the aircraft was recovered, I saw it was near the down position, but not locked).

On short final, I did not perform a normal visual gear down check as I normally do in retractable gear aircraft.

I proceeded to a normal landing, albeit with the power drawn back nearly to idle on short final. The flare and landing were normal and on centerline, except for the belly landing.

We exited the aircraft normally and noticed the beginning of a fire under the left wing center section. I began calling the FBO, but noticed an FBO vehicle already enroute.

We attempted to extinguish the fire using two hand extinguishers in the FBO vehicle, but were not successful. In retrospect, I believe extinguishing the fire would have been possible, but I was not comfortable getting close enough to the aircraft to accomplish the task.

The fire department was called and was able to extinguish the fire, but not until the fire had burned for several minutes, progressing into the fuselage.

The aircraft remained on the runway for about 1 1/2 hours until recovery equipment arrived at the scene and removed the aircraft.

Following the recovery of the aircraft, I observed that the gear lever was near the down position, but not locked in the detent. I also observed that the flaps were in the retracted position and did not exhibit scratch marks as would have been expected if they had been extended on touchdown.

Based on the state of the aircraft after recovery, I believe I mistakenly moved the gear lever when I intended to lower the flaps.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I could have prevented this accident using any of the following:

- 1) Noticing the lower-than-normal power setting on final approach and determining that a go-around was warranted
- 2) Performing a final gear down check on short final

Further, if I had performed a recent practice flight including gear extension and retraction procedures at altitude, I might have avoided the mistake.

Note: I did not research the specific AWOS report at the time of the landing, but it was good VFR conditions. Weather was not a factor.

Note: I was not able to identify the make and model of the ELT, as it was damaged in the fire. The unit had been serviced with a new battery and checked for operation in December 2022. I do not believe the ELT would have activated on the landing, as it was a smooth landing.
