NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

This was the third flight of phase I testing. The engine and aircraft performed normally as expected for the first two flights. The plan was for a local flight to practice level flight, standard rate turns, and slow flight. It was known that the aircraft could develop a high sink rate when underpowered and this was expected. The weather was VMC with clear skies and unlimited visibility. There was a slight wind from the SE making runway 13 the active runway. Takeoff time was 9:42AM local and accident time was 10:03AM local. After takeoff, there was a straight climb until 1000AGL and then a series of standard rate clearing turns were made east of the airfield. The aircraft was slowed to 50kts and flaps were placed to full to evaluate the slow speed handling characteristics of the aircraft. Once this was done, the pattern was entered at a 45 degree angle into a left downwind. The base and final turns were made as the aircraft was flown at 50ts with full flaps. The approach was flown deliberately higher than normal as the high sink rate had been a factor on the first two flights. The numbers were crossed at about 50 feet with a slight left crab for wind. About 1/3 the way down the runway and despite being "ready for it" a high sink rate occurred as the aircraft was about 30 feet off the ground. The impact was hard and immediately the ELT was heard as the aircraft bounced. Upon impacting the runway a second time, the aircraft remained on the ground but there was a total loss of rudder control and the aircraft veered off the left side on the runway into a ditch where it nosed over and came to a rest in a nose down left wing down manner. Ignition switch and fuel selector were turned off and all other electrical switches were turned off before the pilot exited the aircraft without injury. A nearby taxiing aircraft stopped and the pilot asked if assistance was required. None was although the other pilot helped right the aircraft so it was no longer left wing down. The pilot of the accident aircraft called 911 within 1 minute of the accident at 10:04AM stating an aircraft had entered a ditch at the airport and was leaking fuel and police and fire services were requested. No injuries were reported at that time. When fire and police services arrived, buckets were used to collect the leaking fuel. The leak was from the gas caps due to the unusual attitude of the aircraft and as soon as the aircraft was pull level and out of the ditch, the leaking stopped. About 1 gallon of 100LL was collected in total. Probabaly another gallon was lost on the ground. The ELT which was on for about 30 minutes before it was shut off. There was an initial phone call from the Air Force at 10:09AM and a follow up call at 10:33AM once the ELT was shut off. Again the fire service helped tow the aircraft back to the owner's hangar where it remained untouched (except for disconnecting the battery) until FAA representative Daniel L Sindt came by at 2pm for an inspection.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Although confident in his abilities, the builder/pilot had no transition training in this new aircraft. An attempt was made to get transition training by emailing the manufacturer but they could not recommend any previous builders where this could be obtained. Except for a quick internet search, no additional attempts were made to get transition training. In retrospect, training for a STOL aircraft should have been obtained by any means possible even if it were in a different STOL aircraft.
