Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Corner of 50x50 ft metal hangar was damaged from nose of the aircraft going through the sheet metal. One propeller blade broken approximately halfway up. Right wing root leading edge and copilot door damage from hangar impact. Windscreen broken from hangar impact. Right main gear sheared from impact with concrete hangar slab.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Departed Center Municipal (F17) at approximately 1330 local time, after topping off with fuel. Takeoff, cruise and descent into RCADE Ranch (35XA) were uneventful. Lufkin, Huntsville, and Cleveland airports were reporting winds from the south, variable 170-200 and anywhere from 7-12 knots steady, with up to 22 knot gusts. A full flap (40 degree) approach at 60 mph was planned and executed to runway 12. At approximately 40 mph on rollout, a strong wind gust from the south lifted the right wing. Full right aileron and full right rudder had no effect, nor were the right brakes effective. A go around was not initiated due to the narrow strip and both the hangar and tall trees being in the way. The hangar was impacted at approximately 20 mph in roughly a 45 degree angle to the SW corner.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Both the airplane and the pilot are very capable of landing in high (30 knot) crosswinds. However--the short and narrow strip with ~80 foot pine trees on all sides, combined with the direct crosswind gusts of ~30 mph was not taken into account. On a normal strip without obstacles on the sides and at each end, if directional control begins to be lost a go around can easily be initiated and either another attempt, a different runway, or a different field can be utilized. In the future at a short narrow strip (surrounded by tall trees), if the crosswind exceeds 10 knots (including gusts) I will land elsewhere--a longer runway with no or fewer obstacles and/or less of a crosswind component, where I can add a gust factor (70 mph approach speed, 30 degrees of flaps and a main wheel touchdown in this airplane).
