

Timothy Sorensen
Sr. Aviation Accident Investigator
Aviation Safety - Central Region

Date: July 20, 2023
Subject: CEN23LA297 - Boelus, Nebraska
Contact: Greg Whisler - Whisler Aviation

Mr. Whisler stated that they had recovered the airplane from the accident site. During recovery, about 15 gallons and 5 gallons were drained from the left- and right-wing fuel tanks, respectively. Approximately, another 1 or 2 gallons were lost through the fuel tank vents when the airplane was lifted. He noted that the airplane was resting left-wing low at the site which may have resulted in some transfer from the right tank to the left tank before it was recovered.
