Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Left lower wing spars broken, Landing gear spring bent, cowl/nosebowl/spinner damage, engine (stoppage).

No property damage.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I departed KCPK at 0815 for a VFR flight to Mr. Abe Godfrey's private crop duster strip to visit friends. I had made this flight several times prior. The 30 minute flight was uneventful in CAVU skies and calm winds. I circled the field at 2000 feet to observe conditions and entered the pattern on an extended downwind for a landing on the East Northeast aligned runway (8). The flight in the pattern was routine all the way down to a smooth touchdown and initial roll out. On rollout the plane drifted right and the right wing contacted the soybeans immediately bordering the side of the runway. This caused the plane to veer more to the right initiating a ground loop into the field and a partial nose over occurred before settling back on to the landing gear. The aircraft came to rest less than one and a half fuselage lengths into the soybean field and roughly 600 feet down the runway from the touchdown point. All parts of the aircraft remained attached, there was no debris field. There was no damage to property other than substantial damage to the accident aircraft. There were no personal injuries.

On roll out I became disoriented by the lack of normal visual references. The flat featureless surrounding soybean field and the grass runway shared the same shade of green. Like a more familiar Pitts Special, there is no forward visibility in an Acrosport II. Peripheral vision is used to judge orientation, distance and height in relation to the surrounding features adjacent to runway. I lost my perception of the runway center allowing the plane to drift right. I looked to the right to assess the drift and this only exacerbated the drift (you tend to drift where you are looking).

I was in excellent health. There were no other contributing physical conditions existing in the aircraft or runway.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I should have been more aware of disorientation caused by featureless surroundings. These conditions are similar to landing a float plane on a large calm lake. The lack of a color distinction is equally disorienting, in this case green grass and green soybeans. Current runway conditions and current details of its features must be researched thoroughly prior to flight. General experience with a specific field is not enough, as conditions can change rapidly, especially at a private field.

Also, this type of aircraft is unique in that it has no forward visibility in a 3-point attitude. The pilot must rely on peripheral vision to judge the runway center. This requires landmarks such as trees, buildings, windsocks, and other features including a color distinction between the runway and the surrounds. When these features do not exist at the destination runway, an alternate runway should be selected.

Additionally, there is a tendency to drift in the direction you are looking when you turn your head/vision to one side or the other. This should be avoided with reliance on peripheral vision.
