NOTAMs (D and FDC), AIRMETs, SIGMETs, PIREPs in effect at the time of the accident/incident:

At time of attempting to fuel at Sac City I did not see the NOTAM for out of service fuel pump. I selected the FBO and called the number listed but never noticed the red flag NOTAM. After the crash I looked at the FBO again and noted there was a notam in effect.

Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Damage to both wings and fuselage. damage to the propeller, rear window broken. Pilot side landing wheel damaged. Frame bent as passenger door will not open.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I departed KROS at 1542 en-route to KCBF to meet up with an acquaintance of my wife. I had been training for my IFR certificate. I needed more cross country time as part of my qualifications to meet IFR certification standards. This was a good opportunity to gain several hours. The weather was hot and humid, no reports of weather en-route and no adverse conditions reported to deter my flight. Prior to starting the engine I marked the time of departure and the time on the Tachometer. I took off uneventfully and flew at 2500' to pass under class B airspace through Minneapolis. I communicated with Anoka (ANE) tower to gain clearance through their airspace and was approved. I subsequently gained the same permissions to pass through Crystal (MIC) as well as Flying Cloud (FCM), all permissions were granted without incident. I noted a substantial headwind (in my mind I noted it to be around 20 knots. I looked at my indicated airspeed, then my Foreflight indicated ground speed, to get an idea of what the head wind was.) I planned on gaining altitude once clear of Minneapolis airspace. Near Mankato I began to climb to 9000 feet MSL, at that altitude I noted improved ground speed and improved estimated time en-route to my destination. I continued at that elevation for some time and leaned out the mixture to attempt to save fuel. I looked at my tach time and did mental math to ascertain if I would need to stop for fuel. I decided to stop at Sac City (SKI) to fill up on fuel. I checked the FBO and noted that 100LL was on site. I communicated with my wife that my time in route would be longer due to refueling. Upon arrival to Sac City I attempted to fuel and was unable as the pump was inoperable. I used my Foreflight on the ground to pull up the FBO and call for assistance. I did not see any red flag that was a NOTAM indicating that the fuel pumps were out of order. (after I crashed I looked back at the SKI FBO and saw the NOTAM and red flag signifying pumps out of order) I called the listed number and got an answering machine. I called again with the same result. The answering machine had a phone number to call for immediate assistance so I called that number in an attempt to get in contact with someone for fuel. No results. Used the ladder to be able to look on top of the wing and visualize the amount of fuel, fuel was noted inside. I reassessed the tach time from the time of my departure and figured my time en-route so far was near 2 hours and 40 minutes. I was under the impression that I had a total of 3 hours 30 minutes at 10 gallons per hour with 39 gallons full of fuel. By that understanding I had 50 minutes of fuel left and my estimated time en-route to Council Bluffs was 40 minutes. I called my brother, the owner of the plane, to confirm my thoughts. I asked him what the total gallons the plane held, he stated "39 gallons". He then stated that he flew it the day before and filled it to the complete top post flight. I asked what is the rate of fuel burn that he calculated for when using the plane. He stated that 10 gallons per hour is the known fuel burn rate. I knew these details but I wanted to confirm. I felt assured that I could make the remainder of my flight and fuel up at my destination point. I taxied out and took off going directly to Council Bluffs. I did not want to climb higher than I needed to so as to save fuel. I remembered I had leaned the mixture out earlier at 9000' and felt further reassured that I would make my destination with the required 1/2 hour of fuel remaining. I flew uneventfully for several minutes and noted that I was about 20 KM out and I contacted the Omaha approach to inform them of my intentions. I was given a transponder code and I set it to it. I was noticed by approach and given the altimeter setting of 2990 and cleared into Council bluffs. I changed the radio to Council Bluffs AWOS 126.575 and listened to the weather, I decided runway 180 was best. I set the coms radio to 122.725 and listened for traffic.

At this point I felt the airplane lose all thrust and momentum. The noise of the engine became low, I immediately felt the plane begin to lose altitude. I looked at my map momentarily while I held the nose level so as to minimize loss of altitude and determine the best glide. I glanced at the map hoping to see an airstrip within gliding distance. This was not an option so I looked outside to find a location to land while attempting to troubleshoot the problem. I Pumped the throttle with minimal to no reaction. I noted a golf course, highway 80, and a dirt road, Sycamore Rd. No power poles or trees. I went for the dirt road as my best option. I maintained the slowest flight possible while attempting to line up for what was my downwind leg. I was at 2500 feet when I lost thrust. I was on a southerly course and Sycamore Rd is East Westerly. I was in a location of crosswind if that was to be my runway. It was the closest option as well. I gingerly turned Westerly and continued my slowest possible controlled descent to the point where my GPS notified me Via my bluetooth headset 500 feet AGL. The stall horn was starting to make noise so I lowered the nose and began my turn North for what would have been a base leg. The corn field below me rose in elevation and it was rising to meet me. I lowered the nose to gain airspeed and make my full turn without stalling out the wing. This put me on an easterly heading parallel to Sycamore Rd, but not over it, my intended runway. I was out of airspeed and parallel to my intended touchdown point. I attempted to glide over the roadway with what airspeed I had left and not stall out. I think the right wing stalled as I reached the tops of the corn stalks. As the right wing touched the corn and the ground the left tire touched the side of the road keeping me level. I held the yoke to my stomach attempting to keep the nose wheel up as long as I could. I decelerated rapidly.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I should have went to the next closest airport for fuel once fueling at Sac City was unoperable. I should have used a more accurate fuel burn number. I was using 10 gal per hour. Since the accident I have become aware that 12 gallons per hour is more accurate. I should have used an actual clock to measure my flight time as the tach time was not giving me the appropriate time to accurately measure my fuel burn. In the future I will have an accurate never exceed time based on a larger safety margin and never exceed said time.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☐ Yes ☒ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)
