Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Fuselage tail boom substantially damaged due to suspected empennage flutter event which resulted in torsional loading of the tail boom. No other damage to aircraft or property.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Motorglider N321AD departed 89TA at 13:26 CDT on 9/7/2023 by self-launch. Climbed normally to approximately 700 ft agl under power, turned electric motor off, climbed nearby to 89TA using thermal lift to approximately 6000 ft agl and began a normal soaring flight to the NW. Flew glider on a soaring cross-country flight approximately 75 miles NW to a point approximately 22 mi N of Hearne, TX airport, KLHB. The flight then turned SW and continued approximately 82 miles to the SW to the point of the suspected flutter event which occurred approximately 8 miles S of the Giddings Lee County airport KGYB. Following the event, the flight continued approximately 60 miles E to a landing at 89TA. The flight from site of the suspected flutter event back to 89TA, and the landing at 89TA, were uneventful. Landed at 17:34 CDT.

At the time of the event, 16:26 CDT, the glider was in normal straight-ahead cruise flight at approximately 81 kts at approximately 4800 ft. Suddenly the glider cockpit began to shake side-side violently and noisily. I felt no unusual condition that preceded the shaking. I made no significant control input prior to the shaking. It felt like the empennage was rocking/twisting from side to side. The glider sped up slightly during the event to a maximum speed of approximately 90 kts. The shaking lasted approximately 10-15 seconds. As the shaking was ending, the glider slowed slightly and I slowed further to less than 60 kts. Altitude loss during the event was approximately 300 ft.

Once the shaking had stopped, the glider felt normally controllable and I made a left turn toward 89TA. Shortly after turning E, I climbed normally approximately 1000 ft in a thermal, circling at 50 kts, and proceeded toward 89TA. Several more thermal climbs were made on the way to 89TA. Cruise was normal at approximately 60 kts. Handling felt normal. There were no unusual noises. All control inputs were gentle. The landing was normal.

At the time of the event, the glider was being flown well within its normal flight parameters limits: VNE 119 kts placarded in the cockpit (118 kts in the flight manual), VA 81 kts. The glider had been flown on several flights recently with similar flight parameters and in similar soaring/weather conditions and there was never any abnormality in flight characteristics, handling, noise, or vibration. This was my 7th flight in the glider since purchasing it used on 9/17/2023.

The glider was equipped with two flight data loggers, used commonly to record soaring flights, which recorded gps position and some flight parameters at one second intervals. The flight loggers are equipped with engine noise level (ENL) sensors. The ENL was elevated during the event, allowing the flight conditions at/near the time of the event to be determined. Note that the speeds reported on FlightAware are inaccurate.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

None at this time. The cause of the apparent flutter event has not been determined.
