Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Classic ground loop with right main gear folding under fuselage plus damage to wing tip and possible other wing damage. Will know after further inspection. All control surfaces show no external damage. No prop strike on asphalt or concrete but light impact in soft dirt. Prop blades show slight paint abrasion but no bending or tip damage.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Obtained tower clearance to depart runway 22 at EAU to conduct 3rd test flight during Phase 1 testing of amateur built aircraft at 9:30 AM on 11/21/2023. After departure and flying east and conducting further in air flight testing we were cleared for a straight in approach on runway 32 at EAU at approximately 9:55 AM. Conducted stabilized approach to runway 32.

Below is report submitted to FAA FSDO office in Milwaukee:

"We were on the third test flight (phase 1 of testing) of this homebuilt aircraft in order to determine flight characteristics and make sure everything was OK. We were cleared by the tower for a 5 mile final for runway 32. We intercepted the PAPI slope indicator and everything looked good all the way down. The descent sight picture was excellent. As we neared the ground, power was at idle as I began the "round out". We touched relatively lightly in a 3 point attitude and skipped up slightly. I added a small touch of power to dampen the return to the runway and then pulled the power to idle again before touchdown. We touched down in a 3 point attitude again and were aligned straight with the runway. As we were rolling, the aircraft turned to the left. I applied right rudder to counteract but was not able to hold the plane from continuing the left turn as we headed for the left side of the runway. At that point we were in the initial stages of a typical ground loop and it got progressively worse until we left the runway to the left and slid sideways and the right main gear collapsed. As far as the root cause, I don't have any good answers. It was a very stabilised approach. We had a long final to get things in order and were right on glide path, speed was good and flap settings normal. It could have been a gust of wind that caused it and/or a delayed or insufficient response on the rudder by me. The wind had been variable during the morning and was increasing as the morning went on. We had departed on runway 22."

Additional information: After aircraft was secure and before transport back to hangar, we followed skid marks from where the aircraft departed the runway on the left side of the runway back to the origin of the skid marks on the right side of centerline. From the point of origination, the skid marks were relatively straight and from the right main tire with no swerving. The straight marks were approximately a minimum of 200 ft in length and then the "arc" increased and were no doubt a result of sideways sliding. We did not notice any skid marks from the left main.
