

NATIONAL TRANSPORTATION SAFETY BOARD PILOT/OPERATOR AIRCRAFT ACCIDENT/INCIDENT REPORT

This form to be used for reporting civil and public aircraft accidents and incidents

BASIC INFORMATION

Accident/Incident Location

Nearest City/Place: Sullivan State: MO

ZIP: 63080 Country: USA

Latitude: 38.1762299 Longitude: 91.0967377

(Enter in decimal degrees or degrees:minutes:seconds)

Accident/Incident Date/Time

Date: 04/11/2024 Local Time: 08:25 am
mm/dd/yyyy

Time Zone: Central

Collision with Other Aircraft: ☐ Midair ☐ On-ground ☒ None

AIRCRAFT INFORMATION

Registration Number: N651ED

Manufacturer: Piper

Model: PA32-301

Serial Number: 32-8106019

Year of Manufacture: 1980

Amateur-Built: ☐ Yes ☒ No If Yes: ☐ Kit/Plans ☐ Original Design Make: _____

☒ IFR-Equipped and Certified

☐ Commercial Space Flight

☐ Unmanned Aircraft

Maximum Gross Weight: 3600 lbs

Weight at Time of Accident/Incident: 3000 lbs

Number of Seats: 6 Flight Crew Seats: 2

Cabin Crew Seats: 0 Passenger Seats: 4

Number of Engines: 1

Category of Aircraft

- ☒ Airplane
☐ Balloon
☐ Blimp/Dirigible

☐ In-Flight ☐ Explosion at Unknown Time
☐ On-Ground ☐ Unknown

Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Both wings torn from fuselage when meeting trees at end of short field. The nose gear was also bent back. I'm not sure if this is considered substantial or destroyed.

I don't believe either fuel tank ruptured and the fuel spillage was minimal and due to the hoses breaking off with the wings.

Aside from the skid marks I don't think the pasture was harmed at all.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Intention of flight was a Pilot's for Christ mission to pick up a friend from KRST (Mayo clinic visit) and take him home to KPGR. The afternoon prior I flew to Rochester to spend the night and planned for a sunrise departure (on the accident day). Upon landing at Rochester (4/10) I parked at Signature and informed the lineman I wanted topped off in both tanks. I performed post flight checks while the fuel truck came and filled me up. I checked my engine oil level at that time. My oil consumption is on average 1 quart per 4-5 hours. Engine oil level was around 7. I added 1 quart to make 8. My normal routine was to depart flights with the oil level between 8-9. We arrived for the accident flight at 5:30 am and waited in the FBO a few minutes before going to the plane. I planned for 6 am to avoid a departure with no daylight vis. Upon arrival at plane I performed my standard preflight including another oil level check, fuel sump and general walk around.

I filed my IFR flight plan for 7000' to avoid icing concerns at higher altitudes near departure. I performed a normal run-up on the ramp and departed with an IFR clearance very close to 6 am. The entire flight was absolutely perfect until it wasn't. Power settings were MP full forward / 2550 rpm / 16gph fuel flow. Approximately two hours into the flight the first indication of a problem was a subtle rpm drop - 2550 to 2520. I sensed it and noted it on my JPI. The engine still sounded normal and consistent with what I'd expect if I pulled the prop knob to adjust. I looked again at my JPI and recall seeing all normal levels. CHT's / EGT's / Oil pressure / Oil T - all normal. I turned the fuel pump on, switched fuel tanks and went full rich with the mixture. No change for better or worse. I then advanced the prop knob forward and saw no change. At this point my concern is growing pretty rapidly. I performed a mag check which was normal. All 6 cylinders (to my recollection) stayed active (on JPI) during each side of the mag check. I recall glancing at my TAS on the Garmin G5 and noting it was steady at 148 which was 3-4 knots off normal pace. I knew there was a slight performance degradation but the engine still sounded very smooth at this point. This "smooth" initial part of the failure may have lasted 1-3 minutes? While running my checklist I was simultaneously looking for diversion options. I recall seeing 8WC at my 11 o'clock but just by glancing knew it was still many miles away. I don't recall seeing Sullivan at that time because my plane icon was bottom center on the foreflight screen and already behind me. I was not expecting a forced landing at this point! As I was continually running through my emergency checklist the engine then began it's final death that included a few drops and surges of the rpm. This may have lasted 5-10 seconds and then it was gone with no remaining thrust. It was a smooth failure with no violent shaking, abnormal smell, or seizure of the engine. I am certain the JPI data (which I don't have access to at this time) will establish a more precise timeline of what transpired.

(Engine had failed) My view out the windows was almost entirely trees. I immediately panned my iPad to center the plane icon and have a full view of what was within the glide ring. Sullivan was at my 5 o'clock and right on the edge of the glide ring. Within seconds of the failure I disengaged the autopilot and started an immediate right turn back towards Sullivan and keyed up KC Center, "1ED I have lost my engine". The controller quickly replied with a heading for Sullivan as I was getting established on it. During that turn back towards Sullivan I looked out all my windows and noted the cow pasture off to my left. I quickly decided those were my two options. My tail wind had now become a strong headwind and I was already factoring that N wind into whatever landing I was forced into. My plan was to track straight at Sullivan and watch the glide ring on extremely close. All I could see between the open area (that I assumed was Sullivan) and my position was trees. I knew I needed to make a quick decision on Sullivan to avoid letting the cow pasture get out of glide range. The glide ring was trending unfavorable so I initiated the turn back towards the pasture and informed ATC "Not going to make Sullivan. I'll be in the cow pasture." During the turn I again considered the wind and set up for a tight right downwind pattern with a landing to the N. Throughout the entire event (prior to base turn to the field) I continued to switch fuel tanks and exercise mixture control / fuel pump switch every ~15-20 seconds. At some point I pulled the prop lever all the way back to potentially reduce drag. I do not recall noting any difference. On the right downwind to the field I knew I didn't need additional glide so I pulled in all 3 notches of flaps. My pax asked what he could do to help. I replied with "you can tighten that seat belt as tight as you can get it."

At this point the trees are coming quickly as our descent rate was rapid. I did not want to end up short in the trees. My calculations said a really tight pattern with sharp / high G turns afforded me the best ability to "hit my spot". I knew the margin for error was very small considering the size of the field and the airspeed my PA32 needed to keep flying. The final turns to get into the field were intense with sharp nose down banks to avoid the stall. My calculations ended up being spot on and I was able to execute the turns to near perfection without stalling. Rolling out to the final approach path occurred almost simultaneously with entering ground effect. I recall skimming the grass for what seemed like an eternity and the plane simple would not sit down. (continued on page 11)

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

At this time I'm unsure of the cause of the catastrophic engine failure and am unaware that anything could have been done to prevent it. I practice regular oil analysis and monitor closely via the JPI 830 and had zero warnings that this was going to occur.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)

Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No
(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

Catastrophic failure from what I understand Aircraft not in my possession.

Total Time/Cycles
On Part

_____ Cycles

Time Since This Part
Inspected/Overhauled

_____ Hours

FUEL & SERVICES INFORMATION

Fuel on Board at Last Takeoff
(Convert from pounds, as necessary)

102 Gallons

Fuel Type

☐ 80/87 ☐ 115/145 ☐ Jet B ☐ Other, specify _____
☒ 100 Low Lead ☐ Jet A ☐ JP8
☐ 100/130 ☐ Jet A-1 ☐ Automotive

Other Services, if Any, Prior to Departure

Added 1 quart of oil - The plane used on average 1 quart every 4-5 hours.

EVACUATION OF AIRCRAFT

Was an emergency evacuation of the aircraft performed? ☒ Yes ☐ No

Method of Exit – Describe how the occupants exited and how many occupants evacuated each location

front door was jammed and could not be opened. We crawled through back and exited out the back passenger door without problem.
Egress likely within 10-15 seconds.

OTHER AIRCRAFT – COLLISION (If air or ground collision occurred, complete this section for other aircraft)

Aircraft Registration Number

Manufacturer: _____

Model: _____

Damage to Other Aircraft

☐ Destroyed ☐ Minor
☐ Substantial ☐ None

Registered Owner of Other Aircraft

Name: _____

City: _____

State: _____ ZIP: _____

Country: _____

Pilot of Other Aircraft

Name: _____

City: _____

State: _____ ZIP: _____

Country: _____

ADDITIONAL INFORMATION (Please type or print in ink)

Use this space if additional space is needed for any answers.

(continued from page 9)

I considered raising my flaps but was so busy on the yoke and rudders I could not exercise the idea. Finally the tires touched and I tried to brake. We were not slowing. I considered a sideways yaw or forward yoke to possibly bury the nose but was not convinced those ideas were better than continuing straight while on the brakes. As the trees came into focus I could make out the larger trunks and did the best I could to direct the plane into a gap. It may have been mostly luck but we hit a gap perfectly. The wings came off which dissipated a lot of energy and we came to a stop shortly thereafter. There was no violent stop. We immediately tried to egress out of the copilot door but it was wedged shut. We crawled to the back and egressed out of the back door likely within 10-15 seconds of coming to a stop. We both contacted our spouses first. My next call was to KC flight service to let them I was on the ground. They suggested calling 911 so that we could be located. I stayed on the phone with 911 until emergency vehicles were at our location.

Standing back and looking at the field it only then became obvious why I could not get the plane to stop. The field was sloped downhill tremendously with wet green grass.

There was almost zero discussion between myself and my pax during the emergency. He was amazing knowing that my entire focus needed to be on handling the situation.

*** I was unsure of how to source the historical weather data for the area near the accident. The only weather I utilized while the emergency was occurring was my on board wind component of 30 knots out of the N at 7000'. Otherwise it was a nice spring CAVU day.

I HEREBY CERTIFY THAT THE ABOVE INFORMATION IS COMPLETE AND ACCURATE TO THE BEST OF MY KNOWLEDGE
