Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

See Additional Information Section on Page 11 of this Form.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

As composed by Dustin Suchor, Universal Flight Concepts Chief Flight Instructor – ASEL/AMEL, FAA Designated Pilot Examiner, Assistant Chief Instructor – Rotorcraft-Helicopter and previously submitted to the FAA.

This supports all the additional documentation and re-creation videos previously submitted to the FAA.

I have conducted extensive research by analyzing the logged flight data from the reported incident that occurred on May 7th 2024 when solo student Michael Hinojosa was flying N502U. From my knowledge and experience I have determined in my opinion it was caused by pilot error for the following reasons.

- Airspeed during approach is stabilized between 70 IAS and 80 IAS. (70 IAS is recommended approach speed)
- Normal rate of descent for a stabilized approach throughout the approach
- Normal pitch, roll and yaw deviations and corrections from those deviations
- Good aiming point over the runway at 500' markers
- Start of the flare seems good, then a sudden balloon up with a hard nose down pitch attitude. (Pitch angle goes from -5 to +4 to a -10)
- G meter reported from onboard accelerometers reported just after time of flare a G+.67 then to a G-.63 after the airplane fell to the ground.
- Aircraft hits the ground with a hard nose low attitude with airspeed at <50 IAS indicated (50 stall speed) sheering off the nosewheel
- Aircraft veers off to the left side of the runway.

Dustin Suchor,
Universal Flight Concepts Chief Flight Instructor – ASEL/AMEL,
FAA Designated Pilot Examiner,
Assistant Chief Instructor – Rotorcraft-Helicopter

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

UFC as operator has a strict company policy that every student pilot operating the aircraft under solo flight must receive dual training within the previous 5 days. In this case the student pilot received dual training on the same day as the accident by practicing 3 takeoff and landings with an instructor. The instructor determined the student was capable of operating the aircraft in solo flight and therefore dispatched him for this flight. We don't see what more we could have done to prevent this accident. We will continue to follow our current company policy.

Dustin Suchor,
Universal Flight Concepts Chief Flight Instructor – ASEL/AMEL, FAA Designated Pilot Examiner, Assistant Chief Instructor –
Rotorcraft-Helicopter

Damage to Aircraft and Other Property,

- Inspection of the damage observed to the landing gear (both the portion of the Nose landing gear that remained on the aircraft and the nose landing gear wheel/pivot assembly that departed the aircraft upon contact with the ground) were torn from each other. Further inspection of the departed piece of the NLG wheel/pivot assy. shows indication of serrations in the leading-edge metal structure that would indicate that the nose wheel/pivot assy. had been torn from the leg support in a top down and rearward motion and was drug behind the nose gear leg for a brief moment prior to its departing of from the aircraft entirely.
- Inspection of the Nose landing gear leg that extends forward and down from the firewall and beneath the engine subframe structure showed that nose landing gear leg assembly to be pushed up and aft into the firewall and well as the landing gear leg itself has been torn from its fire wall mounts and bent to the left substantially.
- Inspection if the nose landing gear/engine support subframe structure showed several of the supports to be bent aft and upwards towards the firewall. Several of the tubular steel support bars were torn almost completely in half during the event.
- Inspection of the engine firewall, and adjacent/adjoining fuselage structure behind the firewall showed that the firewall and lower fuselage had been displaced upward and after by approximately 8", causing the firewall itself (stainless steel) to wrinkle and tear away on some locations and the fuselage carbon fiber/Kevlar composite immediately behind the firewall to crack and displace away from the firewall. Several portions of the upper most part of the nose landing gear structure can now be seen inside the cockpit, just inside of the firewall.
