NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Once I arrived at KDHT, I was marshalled up to the 100LL fuel pumps. Herb and Corey put about 13 gallons into the Tomahawk which was close to a top off. We went inside to grab lunch, take a break and run a few performance charts. I used the POH and knew I had plenty of runway to use for takeoff. Density Altitude was similar to the Density Altitude at KCYS and KPUB which I was able to depart both airports earlier in the day. Herb had moved my airplane with his tug from the pumps to a parking T. After lunch I went outside and did my preflight. I keep it the same everytime I preflight. I had to put in one quart of oil but everything else was good and I was ready to start the airplane up. My run-up was good, all engine gauges were in the green with suction in the green as well. The magneto check was in tolerance according with the POH. I used runway 21 for departure, and I was able to get the airplane up to 70kts on the ground and was able to get into ground effect and able to pop out and start a climb. My Tachometer read between the range of 1900-2100 RPM between full power at the start of my departure and the point after I got climbed out of ground effect, but to my knowledge and what I have been told, this is normal for a higher density altitude environmet. The climb stopped around 300 feet AGL and I noticed a sink starting, when I saw this, I was worried something might have been wrong so I started a shallow bank turn back to the airport. I told my passenger what I was doing. The sink rate was too great and I knew we had to set the airplane down in the field. We had about 10-15 seconds to think and do, my passenger unlatched the top latch for both doors and her door, I unlatched open my door and started pulling the mixture, turning the fuel valve to "OFF," pulling the throttle to Idle, turning the magnetos off as well as the master switch. I tried making as safe of a landing as possible and I did just that with wings level and mains touching with the nose shortly after. I believe that due to the hard, rough surface of the field, that the nose wheel turned to the left which ultimately put us into a skid on the ground.

The airport elevation was 3,991 ft and the terrain around it was flat. The airplane suffered a collapse of all landing gear, wing roots, crumpling around the tail, and a prop strike probably due to the landing gear collapsing.

All in all, upon takeoff and once in my initial climb, I quickly lost altitude as well as airspeed. I tried turning back for the airport, but my sink rate was too great not allowing us to make it back to the airport. No one got hurt and we did our best to keep the airplane in the air for as long as possible but ultimately making as safe of a landing as I could once I knew that was what it was coming to.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Have a better understanding of low Horsepower Aircraft in high density altitude environments.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☐ Yes ☒ No
