Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Aircraft landed on the belly with the gear up in a rough grass field and slid to a stop in deep brush at the end of the field. during the slide to a stop the aircraft impacted debris on ground near the baggage compartment that ripped the bottom of the fuselage, impacted debris on the grown beneath the pilot seat that ripped the fuselage in that area. many other dents and bends in the aircraft surface. See attached photos.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and and location, services obtained, and intended destination. Provide as much detail as possible.

On July 28, 2024 at roughly 9:30am I departed 3CK VMC and opened an IFR flight plan for my return trip to KHYR where I had departed from earlier that morning. I had filled up in Hayward and received no services at 3CK. I was in stable cruise flight at 6000 ft MSL on an IFR flight plan for more than an hour. The flight path was essentially 3CK, DLL, HYR. At approximately 11:30am and 10 minutes from KHYR, Minneapolis Center (MC) instructed me to descend and maintain 4000 ft. I commenced the descent by reducing power to roughly 19 or 20" of manifold pressure and, since I was close to landing, I also enriched the mixture, and increased the prop RPM from 2400 that I was cruising at, to 2500 rpm. I was descending around 500 fpm plus or minus.

The aircraft descended normally, for a minute or two since it was only 2000 feet and at 4000 feet I reengaged my altitude hold on the autopilot and went to advance power slowly to maintain airspeed while leveling off and it felt as though someone had pulled the power back to idle. I felt the deceleration and immediately realized I had lost power in the engine.

In an instant, I advanced the mixture to full rich, pushed the prop full forward, added more throttle/power but nothing changed. I had made a normal fuel tank switch not long before so I switched supply back to that tank but the engine still did not respond so I immediately declared an emergency because I was so low. The last I time I recall seeing the altimeter was roughly when I declared an emergency and it was 3700 feet MSL. I know the area well so I knew the ground was around 1300 feet MSL.

Moments after I declared an emergency, MC told me there was a small airstrip off my left wing so I commenced a turn to the left, disabled the autopilot, slowed my airspeed to 90 knots, looked at the glide ring estimate on my iPad, and noted that I was not going to make the field that MC noted. I let them know I wouldn't make the airport and would have to put it down in a field. I immediately scanned for options and identified a couple of clearings I could reach and opted for one off my nose that was a sure thing. At that moment I could clearly see it was mowed but very short and that there were power lines on the approach end of the field along a small road and that there was a tree line at the finish end. I knew then that I would have to get the plane on the ground quickly if there was going to be a chance of the plane stopping before I hit the trees.

With that 10 or 20 seconds gone, I went back to trying to make the engine run. I opened my bypass engine air, enabled the backup fuel pump on low, then high, cycling the power control each time, and in one last ditch effort, I tried to cycle the mixture thinking somehow it had disconnected.

By then I needed focus on landing the plane and decided to clear the power lines and essentially do a short field power off water landing like in my Lake Amphibious plane. Namely, I knew I needed to use the grass to bleed energy and speed so I was simply going make sure I would clear the power lines, then full flap, leave the gear up, dive to the field, round it out to slow the rate of descent, push it to the ground and hang on.

With that in mind I started a steep (2 or 3X standard rate) turn at 85 kn from downwind to final, thinking all the time don't stall the plane and kill myself. I rolled it out on final a few hundred feet off the ground and did exactly what I described in the previous paragraph, with a directional tweak to the right toward a small gap in the trees while I was diving toward the field.

When the plane contacted the ground it was initially smooth and I recall it sounded like water flowing under the hull and was followed by a kick to the right a few bumps and an abrupt deceleration. After I landed, I immediately assessed the plane was stable with no fire or fuel smell. I then triaged myself noting I had no injuries. After that was done, I put on my head set and contacted the aircraft above me who had just departed KHYR and let them know I was OK.

Note: During the entire sequence noted above I was in communication with ATC and another aircraft that had just departed Hayward and was relaying back to MC after I was too low to talk to them.

I then secured the plane by shutting off power and fuel, took a couple of photos of the plane and exited the plane through the main cabin door.
