Narrative History of Flight

After completing my 12th load of the day, I shut down N420DZ. During the shutdown, I satisfied physiological needs then performed a weather check and walkaround prior to restarting the engine for what I expected to be my final two loads. I elected to continue using my previously selected jump run, as no significant wind shifts were indicated. I knew I would have movement jumpers onboard, so I pre-coordinated their descent to the south, leaving the area north of jump run for my descent.

I departed 48TX to the north at 1800 CDT. Consistent with the rest of the day, surface winds were out of the east. There was a burble on the north end of the runway that I had attributed to being the resultant pattern of airflow around buildings on the northeast end of the airfield. For this reason, once sufficiently clear of the ground, I allowed my nose to point into the wind slightly. I then checked in with Fort Worth Center and turned westbound to make efficient use of my climb box. The climb was uneventful. I made my two-minute jump call to ATC and local frequency prior to intercepting jump run.

I intercepted jump run smoothly, configured my aircraft for the run, and had all jumpers safely exit my plane prior to reconfiguring for a descent. I made radio calls to ATC and local frequency indicating that jumpers were away as I initiated my descent. Generally, a second call to ATC is made once the aircraft is below 6,000 ft, but on this run, ATC released me early based on the absence of traffic in the area. While atypical, an early ATC release was something I had experienced before.

I tried to quickly create distance between myself and jump run as I picked up visual targets to determine when to turn toward the airfield. I made an easterly turn using highway 69 and the quarry north of the airfield as references until it came into view. I ran my pre-landing checks then made a traffic call on local frequency and selected my visual aiming point.

During the approach, I stayed pointed at my aiming point until I began my round-out. Up to this point, the approach felt consistent with preceding approaches in the aircraft; however, this particular round-out seemed insufficient. I added power, but the response was late and the touchdown was hard and flat. It became evident the nosewheel had collapsed. In the interest of safety, I attempted to stay on the runway and quickly perform emergency shutdown procedures. As the aircraft came to a stop, I exited through the left pilot door and was quickly surrounded by personnel checking on me and the aircraft.

Recommendation

My recommendation is to ensure a sufficient round-out is achieved on future approaches. Since my approach felt normal until the round-out, my speculation as to what factors potentially contributed to my insufficient round-out include an improperly timed or inadequate control input and an unexpected environmental factor that created a reduction in elevator authority at a critical moment. As a result, my recommendation when flying this approach is to initiate an earlier or more sufficient round-out and to better anticipate changes in environmental factors. Additionally, while the idle-power approach is approved by the Airplane Flight Manual Supplement, I now recognize that a powered approach may afford a greater opportunity for a successful landing despite different control and environmental factors. I intend to work with others, more experienced in the aircraft than I, to further explore the strengths and weaknesses of different approved approach types.
