Description of Damage to Aircraft and Other Property <i>(Use additional sheet if necessary)</i> Fuselage, Wings, Elevator, and Control Surfaces appear intact. Nose Wheel is partially separated from aircraft and pushed aft. Main Gear tires are intact with separation from the wheel assembly. Dust in Engines from EMAS		
NARRATIVE HISTORY OF FLIGHT <i>(Please type or print in ink)</i>		
Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.		
Departure was planned from Rwy 27. ATIS obtained and loaded into FMS. Flaps set to 15° and fuel loaded was enough to reach destination with reserve. Initial calculations indicated a takeoff roll of about 6800-6900 ft.		
During the takeoff roll, the aircraft was unable to produce enough airspeed to meet the 50/75 rule (75% of takeoff speed at 50% of the runway), and an abort was called. Braking, Airbrakes, and Thrust Reversers were used, and the airplane wasn't slowing down. At the 1000' mark maximum braking (overriding the anti-skid) applied and the aircraft departed the runway on the North side of the EMAS pad, which stopped the plane about 150' from the threshold.		
After coming to a stop, the Thrust Reversers were closed using force, as the handles did not want to lower. APU stopped. Force also used to close the HP and LP cocks for fuel flow, however the engines were not stopped with this action. Airport personnel disconnected the batteries in an attempt to stop engine operation, without success. Engines finally stopped using manual control of the Fuel Control Unit under the direction of a Weststar mechanic who was on the phone with airport personnel.		
After exiting the aircraft, it was noticed that the flaps were set to 0°, which was unexpected.		

RECOMMENDATION (How could this accident/incident have been prevented?)													
Operator/Owner Safety Recommendation This airport has a short runway, and sits at an altitude that makes any summertime departure under high temperatures / high DA a high-risk departure. The recommendation is that no plane that is even close to limits should depart until weather cools in the morning, where better performance can be achieved. Weight also plays a factor, and use of lighter loads and a refueling site no more than 1 state away may help. Finally, a runway analysis tool like APG would have flagged the unfavorable conditions without the likelihood of choosing a wrong page or reading a wrong line using the performance figures provided.
