☐ In-Flight ☐ Fire at Unknown Time
☐ On-Ground ☐ Unknown

Aircraft Explosion

- ☒ None ☐ Both Ground and In-Flight
☐ In-Flight ☐ Fire at Unknown Time
☐ On-Ground ☐ Unknown

Description of Damage to Aircraft and Other Property *(Use additional sheet, if necessary.)*

Nose wheel strut and nose landing gear collapsed on the landing, breaking free from it's attachment point on the engine mount. That put the nose on the ground and caused a prop strike. The prop is beyond repair. Engine must be torn down and fully inspected. The tubular steel engine mount is broken where the landing gear attaches, so it probably will have to be replaced. There may be some firewall damage, but it looks undamaged to the naked eye. The aircraft slid to a stop on the fuselage belly sliding on the belly skin immediately behind the firewall. There may be some damage there.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink.)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

This narrative is provided by Henry S. Eilts, the instructor pilot on the flight.

The event occurred while doing touch and go takeoffs and landings at McKinney TX (KTKI) in a C150F aircraft. This was an instructional flight with only the instructor pilot and student pilot aboard. Runway 18 was the active runway. The winds were light out of the east. The AWOS broadcast the winds at 120 degrees at 10kts, but there is an old orchard 0.2 nmi. to the Eastsoutheast that blocks much of wind. I estimate the wind at approximately 5 kts.

The student pilot has more than 20 hours of flight time and is very close to soloing. The purpose of the flight was to practice landings. The first circuit around the traffic pattern was unremarkable. The student maintained airspeeds, altitudes, and headings, as well as ATC communications without instructor prompting. We normally land the aircraft with 20 degrees of flaps at 65 mph short final airspeed. The first landing was good, as was the post landing cleanup and the takeoff for the 2nd circuit. It too was uneventful through the pattern until the landing flare. The student reduced power to idle and rounded out the aircraft in the flare to a level attitude about 4 feet above the runway and level. I instinctively checked his airspeed, which was above 60 mph. Almost coincidentally with my looking at the airspeed indicator, the nose of the plane pitched down to what seemed like -10 degrees (i.e. nose down). There was not enough time for me, the instructor, to react to this before impacting the runway. The nose wheel impacted the runway and immediately broke off, putting the nose on the ground and stopping the engine. The plane slid for several seconds over a distance of 100 feet estimated, perhaps farther. Prior to the impact, the plane was within a few feet of the runway centerline and aligned with the runway and not drifting to the side.

Since the airframe was unbent, evacuation was simply a matter of opening the doors and stepping out of the plane and onto the runway, which both pilots did.

In spite of breaking the nosewheel strut away from the engine motor mount, the impact with the ground did not seem severe. It is possible that metal fatigue could have contributed to the accident. Neither the student nor the instructor sustained any injuries. Visually, the airframe looks unbent except for the nose wheel and it's attachment hardware

OPERATOR/OWNER SAFETY RECOMMENDATION *(How could this accident/incident have been prevented?)*

From Henry Eilts, the instructor pilot on board:

Instructors must train and remind themselves to be vigilant at all times, Randall, the student, had just returned from a 5 week layoff from flying. The instructor should have been more vigilant and should have expected some reduced pilot performance, Perhaps monitoring the control yoke with his hands lightly on the controls would have resulted in a different outcome.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on a separate sheet.)Was there Mechanical Malfunction/Failure? ☐ Yes ☒ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

It is unknown if metal fatigue in the nose strut attachment hardware played a part in the accident.

Statement by Randall L. Smith, student pilot (# [REDACTED]), regarding 1/4/2025 accident in N3589L

My instructor, Hank Eilts, and I took off at approximately 09:33 (per FlightAware.com's track log) for touch and go landing training at McKinney National Airport (KTKI). I was feeling confident because two days before I had a good day of touch and go landings at KTKI.

We had conducted one landing and went through again the landing checklist of carb heat, fuel, mixture, seatbelts, and flaps at 20 degrees in preparation to land on Runway 18. I applied more power in our final approach to the runway to increase speed to between 65 and 70 mph. I then cut power once over the threshold markings. I was attempting to correct for a ESE (120 degree) 10 knot crosswind (per ASOS report KILO at 1453 Zulu) as we drifted right of the runway center line. While dipping the left wing to recenter the plane on the runway, I failed to properly maintain flair at the same time. When about five feet above the runway the nose dipped and we struck the front landing gear first, immediately collapsing it. We slid forward in line with the runway to a stop. We had no injuries and no leaking oil, only fuel dripping from the vent tube as the plane was on its nose.
