Description of Damage to Aircraft and Other Property (Use additional sheet, if necessary.)

Nose landing gear broken, both wing leading edges damaged, wing spar broken on left side at attach point, multiple damaged areas on fuselage.

NARRATIVE HISTORY OF FLIGHT (Please type or print in ink.)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

My student and I met at KGXY hangar at approximately 8:00 am Monday April 07 for a flight lesson. Our lesson for the day was to practice basic air work, a simulated engine failure maneuver, a few ground reference maneuvers and then return to KGXY for a few take off and landings.

Upon arrival at the airport, the student already had the airplane pulled out of the hangar and his preflight was completed. We discussed the lesson, the weather, NOTAMS and the TFR that effected our flight. After departure we flew around the TFR enroute to the practice area which is over Pawnee National Grasslands. Enroute, we practiced multiple medium bank and steep bank turns. Once we were over our practice area, I gave my student an east heading to stay parallel with the section lines. At 7,500 (as I recall) I told my student we had a simulated engine failure and I asked him to perform his memory items and tell me what he was doing as he performed each item. He maintained altitude and trimmed the airplane to "best glide" performed the memory items and chose to land straight ahead as he thought his previous instructor had told him to do. We talked about the terrain straight ahead and the terrain to the north and south. I explained why I felt the terrain was better to the south so we set up to fly a simulated right traffic pattern to the planned landing sight. There was some confusion between the two of us on exactly which field we were setting up to land in. The pasture he was setting up to simulate the landing in I could see had some obstacles that would not allow a safe landing. I was suggesting he land toward the Southwest away from obstacles. I don't think he was clearly understanding my suggestions. At what I estimated to be about 300 to 400 ft I instructed a go around. The student hesitated for a moment and then retracted the flaps with out adding power first. This happened very quickly and caught me a little off guard. I immediately took the airplane, added full power, pushed the nose down and began to recover from a near stall at a low altitude. The stall warning came on immediately when the flaps were retracted. The terrain ahead of us had trees and what appeared to be an old house foundation. I tried to turn the airplane slightly left as we gained speed and I recovered from the low altitude near stall recovery. As the airplane approached the terrain, I had a relatively high angle of attack as I was trying to round out the descent and avoid contact with the ground. It was difficult to see directly in front of me because we were "behind the power curve". I felt that once I was in ground effect I could add a notch of flaps and begin a climb. I knew I was over a road at this point, but I was not able to see clearly down the road, as I only had peripheral vision. Furthermore, I could not see down the road because the terrain was hilly and there were multiple hills in front of us. The "mains" settled on to the terrain, I was about to add a notch of flaps to get the airplane airborne again, but something caused a dramatic left yaw. I had full right rudder in and lowered the nose to see what was in front of me, but the yaw was so powerful I elected to pull all the power off the airplane and discontinue the recovery. We crossed the road at an estimated two-degree angle, went through a fence and ended up in a pasture facing 90 degrees from our original path. I believe, but I'm not sure, the left wing near the tip, hit either a post or a fence causing the left yaw and loss of control of the aircraft during the near stall recovery.

After the airplane stopped, I evaluated the condition of the airplane, checked to make sure my student was OK and I secured the airplane by shutting down the electrical, and fuel systems. I could see after the accident that the left-wing struck something round, probably the fence post and as the airplane veered left, the right wing also struck a fence post.

OPERATOR/OWNER SAFETY RECOMMENDATION (How could this accident/incident have been prevented?)

Better briefing with student on his training procedures prior to the flight. We should have reviewed the go around procedure from the briefing room several times so that the student fully understood the procedure. Also, selecting a higher go around altitude would have prevented the accident.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on a separate sheet.)Was there Mechanical Malfunction/Failure? ☐ Yes ☒ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

Total Time/ Cycles On Part

_____ Hours

_____ Cycles

Time Since This Part Inspected/Overhauled
