NARRATIVE HISTORY OF FLIGHT (Please type or print in ink.)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On June 26, 2025 around 11am, I conducted a dual instructional flight with a student in a Tecnam P2010 (IO-390, 215 HP), registration N258CM, at Draughon–Miller Central Texas Regional Airport (KTPL). My student and I completed a full preflight inspection and found no abnormalities. The aircraft had 17 gallons of fuel in the right tank and 13 gallons in the left. During the run-up, the engine operated normally. We were conducting pattern work on Runway 16 and successfully completed two touch-and-go landings with no issues or abnormal engine indications.

On the third pattern, our G1000 had a blinking message to swap fuel tanks, which it sends every 20 minutes. I saw that the right tank had a bit more fuel than the left (I don't remember exact values for either), and in the downwind I swapped the fuel selector to the right detent. I verified fuel pressure was still in the green and within limits after swapping. Before turning base, I verified that fuel pump was on, mixture was full rich and propeller was full forward, being the normal landing configuration. I had my student slow the plane below Vfe, reduce throttle to 15 inches of manifold pressure, and put flaps to the T/O position. We turned from base to final at approximately 400 feet AGL, with flaps still at T/O and throttle at 15 inches.

While on short final, I noticed the manifold pressure began increasing up to 22 inches, even though the throttle had not been advanced. At the same time, I felt the energy of the aircraft bleeding off — that was the moment I knew something was wrong. I took control from the student and applied full power and nothing happened. Manifold pressure did not increase rapidly, and airspeed did not increase. Despite there being no warnings or cautions from the G1000, I knew the engine had quit at that point.

I immediately focused on keeping the plane flying and looked for a place to land. I had to avoid the MALSR lighting system just north of runway 16, and the only remaining option was the trees. I attempted to switch the fuel selector to the left tank in the hopes of restarting the engine, but there was no change. I verified that the fuel selector, mixture, and propeller controls were all in the proper positions. I kept the nose down and maintained control of the aircraft to avoid a stall. The aircraft impacted terrain (mostly trees) a couple thousand feet short of the runway threshold.

Post-accident actions: Upon hitting the ground, I assessed that both my student and I were okay. I then made a series of phone calls. First, I called Ian Mullins, then the Temple airport. I was able to state that our plane had crashed and that we needed emergency services.

However, before I could provide more information, the call ended, and my phone automatically dialed 911 after detecting the crash. I canceled the 911 call, trying to continue the call with the Temple airport, but both calls had already disconnected.

At that point, we needed to get out of the aircraft. My student's door would not open due to debris blocking it. My door was functional, so I helped her climb over, and we both exited from the right side of the plane. While we were getting out, Ian called me back. I told him we had crashed on short final, and he said they were on their way.

We proceeded to move away from the aircraft and created space between us and the wreckage. We stood by the airport perimeter fence. Within a minute or two, emergency services arrived on scene, including fire trucks.

There were no serious injuries. Both my student and I were evaluated and cleared by EMS on site.
