

Accident Prevention

1. Pay more attention to Elevations and Density Altitude
2. Fuel for safe flight, not distance when in these conditions
3. Fly overflights at a faster speed and use/don't use flaps more appropriately
4. Do not fly as low AGL without greater familiarity with all conditions
5. Failure to release flaps was probably a primary factor in lack of climb ability
6. Be ready to apply opposite rudder immediately during slow flight in case of stall
7. A major lesson, assess conditions and plan and fly with intent
