Description of Damage to Aircraft and Other Property (Use additional sheet, if necessary.)

Aircraft was totaled/destroyed.

NARRATIVE HISTORY OF FLIGHT (Please type or print in ink.)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Departed KUNU as part of a flight lesson at approximately 8:50am CST with the intended destination of KRYV. Obtained weather via the RYV AWOS on 119.975 and also looked at EFB Foreflight for weather information. The weather was clear with calm winds and Runway 23 was selected for the destination airport at KRYV. A crosswind pattern entry was selected for Runway 23 as we were entering the pattern from the North, slightly Northwest. A standard left hand turn to the downwind was made. At the abeam point, the pattern was normal. I instructed the student to reduce power to 20%, check that the airspeed was below 120, and put in 50% flaps. We then executed a normal downwind to base leg. We rolled out on the final leg on speed and slightly above glidepath. Once the wings were level and we were lined up with the runway centerline, I instructed the student to check our airspeed to ensure we were under 100 knots put in the second flap setting of 100%. The airplane decelerated to 80 knots when I looked and ballooned and I instructed the student to push forward on the controls to overcome the balloon, reduce power slightly and to and keep the nose of the plane pointed at the numbers to remain on glidepath. At this point, the VASI showed two white lights. As we were on short final we were slightly high and fast but in my judgment it appeared like we would be able to land within the first ¼ of the runway on speed. The VASI lights transitioned from two white to one white and one red right about over the displaced threshold, indicating that we were on glideslope. As we crossed the numbers, I instructed the student to pull the power to idle and transition their sight picture down the runway for a landing sight picture and in the flare, that we would have to hold the plane stable with that sight picture while the airspeed bled off to execute a normal landing since we had some extra airspeed. At this time I would estimate that we were approximately 5 knots fast but no more than 10 while entering the flare. The student had his hand on the throttle and I had my left hand near the throttle, my right hand on the controls, and my feet on the rudder pedals. We touched down approximately at the 2nd stripe after the numbers. The landing did not feel hard or abnormal. The airplane bounced, came back down, and then bounced again. After the 2nd bounce I took over the airplane to execute a go-around. I added full power, pitched the plane to level to gain airspeed, and input right rudder. The airplane was not gaining speed as expected, bounced again, and the stall horn was audible. Since the plane was not accelerating I then selected the go-around flap setting of 50% attempting to get the aircraft to accelerate in ground effect. The plane tracked to the left and a part of the left wing (unsure if it was the gear or the wing itself) hit a runway side light. The control inputs of right rudder and ailerons that I input trying to control the plane were not effective and the plane was still not accelerating as expected. I then pulled the power all of the way back as I knew the plane was not going to fly/gain speed and moved my feet up and onto the brakes. The plane exited the runway about ⅓ to ¾ of the way down off the left side, spun around after hitting the grass, and went tail first into the brush. After the plane came to a stop, I made one call on the unicom frequency saying that we had a runway excursion. We turned off all of the switches, turned off the fuel pump, cut off the mixture, put the throttle in the idle position, turned the fuel selector to the "off" position, turned the ignition to the off position, and removed the key. We gathered our items, opened the doors, and exited the airplane off of the wings.

OPERATOR/OWNER SAFETY RECOMMENDATION (How could this accident/incident have been prevented?)

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on a separate sheet.)Was there Mechanical Malfunction/Failure? ☐ Yes ☒ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

Total Time/ Cycles On Part

_____ Hours

_____ Cycles

Time Since This Part Inspected/Overhauled

FUEL & SERVICES INFORMATION

Fuel on Board at Last Takeoff

(Convert from pounds, as necessary)

16.0 Gallons

Fuel Type

☒ 100 Low Lead☐ Automotive☐ Jet A☐ Jet A-1☐ Unleaded AV☐ Other, specify _____

Other Services, if any, prior to departure:

EVACUATION OF AIRCRAFTWas an emergency evacuation of the aircraft performed? ☒ Yes ☐ No

Method of Exit – Describe how the occupants exited and how many occupants evacuated each location:

Both occupants opened their doors and exited by stepping onto the wing and then onto the ground from the wing.

OTHER AIRCRAFT – COLLISION (If air or ground collision occurred, complete this section for *other* aircraft.)
