Description of Damage to Aircraft and Other Property *(Use additional sheet, if necessary.)*

Substantial damage to the right wing, right main gear, cowling, propeller, and vertical stabilizer.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink.)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On Sunday, April 19th, at 10:40 MST, N1398K departed a private grass strip approximately 23nm to the south of KEE0 en route to KGJT. An outlook briefing was obtained via Foreflight the night before since there was no service at the airstrip. The winds were predicted to be calm, and no adverse weather conditions were noted. Proper preflight calculations and inspections were completed, including takeoff distance and weight/balance. The aircraft was 76lbs below max gross weight and within the CG limits. It was determined that 1,200 feet of the 2,040-foot runway was needed, including a safety margin. A predetermined abort point was selected if there was any reason for an aborted takeoff, allowing for a safe stop as well as a straight-ahead landing spot. Once the engine was running, roughly 15 minutes were used for engine warmup, taxi, and runup procedures. During these procedures, the windsock on the site remained limp, indicating no wind. A downhill departure was selected for shorter takeoff performance and the continually lowering terrain exiting the valley. As the takeoff roll began, the windsock was verified, still indicating calm winds; full power was set, brakes were released, and gauges were crosschecked. Airspeed quickly came alive, and RPMs indicated normally. I rotated well before my predetermined abort point and with sufficient airspeed. I continued my climb at VX and exited ground effect climbing at around 400fpm. Shortly after leaving ground effect, I noticed that my VSI indicated a downward-trending climb rate. I pitched forward, maintaining VX. I quickly realized that I was still descending at roughly 300-400fpm at around 30AGL. I determined that I was unable to outclimb the downdraft/windshear and opted for a straight-ahead forced landing. I maneuvered the aircraft away from a ravine that was noted in my pre-takeoff emergency brief. I attempted to arrest the descent rate and touch down with as little energy as possible. The aircraft touched down in a three-point configuration in tall, thick sagebrush. The aircraft eventually nosed over, coming to rest upside down. I verified that my passenger was able to exit as I shut off fuel and the mags. Both occupants of the aircraft were unharmed and no services were needed. I disconnected the battery, shut off the ELT, and secured the aircraft for further inspection.

OPERATOR/OWNER SAFETY RECOMMENDATION *(How could this accident/incident have been prevented?)*

I believe this could have been prevented by carrying less weight and leaving earlier in the morning. I simply was not able to outclimb this downdraft/windshear, leading to a forced landing. As the morning went on, density altitude increased, and the atmosphere began to move more. While I can not guarantee this would have prevented the accident, more engine performance and more stable air would have reduced the negative effects on the aircraft.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on a separate sheet.)Was there Mechanical Malfunction/Failure? ☐ Yes ☒ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)
