Aircraft Explosion

- ☒ None ☐ Both Ground and In-Flight
☐ In-Flight ☐ Fire at Unknown Time
☐ On-Ground ☐ Unknown

Description of Damage to Aircraft and Other Property *(Use additional sheet, if necessary.)*

Aircraft sustained visible damage to the propeller and nose landing gear. The propeller blades exhibit bending/deformation consistent with a propeller strike. The nose landing gear appears damaged and displaced. No other damage is readily apparent from the exterior. Additional damage, if any, is subject to further inspection.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink.)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

During engine start, the aircraft did not start immediately. I attempted to start the engine four times, allowing approximately one-minute waiting periods between attempts. Once the engine started, all indications appeared normal. Oil pressure was in the green, and the engine stabilized at approximately 1,700 RPM.

This was an engine break-in flight, so RPM needed to be maintained at 1,500 RPM per our "Engine Break-In" procedure. Once the airplane started, I reduced power from 1,700 to 1,500 RPM.

After making my taxi call, I observed an aircraft holding short of Runway 18 and announced my intention to back-taxi. While taxiing at 1,500 RPM, I conducted the magneto check. Part of our new engine break-in procedure called for immediately taxiing the aircraft and conducting the taxi and run-up checklist while taxiing to the runway. The left magneto showed a 100 RPM drop, and the right showed approximately a 90 RPM drop. Both appeared normal.

After completing the check, I entered Runway 18 and began the takeoff roll. I gradually applied full throttle, or what I believed to be full throttle at the time. I verified that the engine indications were in the green and that the airspeed indicator was active. I verified this with my left hand, which came off the throttle.

About one-third of the way down the runway, roughly 900 feet, full power was pushed forward. As I approached the windsock, I checked my indicated airspeed, which was around 45 knots. Our engine break-in procedure called for a rotation speed of 75 knots, approximately 20 knots faster than our normal rotation speed of 55 knots. I began comparing my airspeed to the remaining available runway and recognized that my airspeed was too low for my position on the runway.

About halfway down the runway, around 1,350 feet, I knew the aircraft was not going to reach the 75-knot rotation speed. I decided to abort the takeoff. I reduced the flap setting by one notch, reduced power to idle, and applied braking.

At around 60 knots, the aircraft briefly became airborne before settling back onto the runway. At that point, I determined I was traveling too fast to safely make the available runway turnoff. My intention was to continue slowing and turn left onto the taxiway rather than continue toward the departure end of Runway 36.

During the turn, I exited Runway 36 and crossed near the hold-short line. The aircraft then departed the paved taxiway and entered a small ditch/grass area. The nose wheel came to rest on the concrete taxiway, while the main portion of the aircraft remained in the grass/ditch area between the runway hold-short area and the paved taxiway.

OPERATOR/OWNER SAFETY RECOMMENDATION *(How could this accident/incident have been prevented?)*

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on a separate sheet.)Was there Mechanical Malfunction/Failure? ☐ Yes ☒ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)
