Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Broken propeller, broken right main gear, broken nose wheel, punctured wing tips.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On 17 June 2015 Falcon Aviation student Tao Zhang "Number" and I planned and a cross country time building trip to Huntsville AL. We picked up flight following over to Huntsville where we landed runway 18L (touch and go). We then departed Huntsville for Newnan GA. We picked-up flight following again back to Newnan, GA. We arrived back at Newnan, GA where we did the RNAV14 approach circle to land to runway 32. We did a touch and go back to EQQ to return for the LOC 32. After completing the runway 32 approach we checked the hobbs time and remaining fuel quantity. All indications checking good we then turned south to La Grange VOR did the approach to runway 13. We broke off the approach and headed back to Newnan GA at 3000'. About 5 miles from the airport the engine began to sputter and kick. I immediately pushed the mixture to full rich, turned on the fuel pump, checked the magnetos and pitched for best glide. Then both me and the student checked the fuel gauge and saw that it was reading one quarter tank which was more than enough to make the airport at Newnan and land with the required $\frac{3}{4}$ tank of fuel, so it appeared. The engine continued to sputter as I jockeyed the throttle to check for throttle issues. This did not resolve the problem. I then turned my attention to the runway and saw that we were too low and would not clear the land obstacle. I then made the decision to make a right turn for an open field area we passed just south of the airport. The engine sputtered a few more times then stopped. I made an emergency call, shut off power, pumps, and lights and controlled the aircraft down to the ground where we landed safely.

After careful examination of our trip planning, we were able to determine that fuel was being burned at a greater rate than calculated in addition to the true fuel quantity being masked by an inaccurate fuel indicator. The aircraft engine ultimately stopped due to fuel exhaustion.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

By using a combination of total run time along with other gauges and indicators to better assess the remaining fuel quantity regardless of how efficient things may appear.
