NOTAMS (D and FDC), AIRMETs, SIGMETs, PIREPs in effect at the time of the accident/incident:

DAMAGE TO AIRCRAFT AND OTHER PROPERTY			
Aircraft Damage ☐ None ☐ Substantial ☐ Minor ☐ Destroyed ☐ Unknown	Aircraft Fire ☐ None ☐ Both Ground and In-Flight ☐ In-Flight ☐ Fire at Unknown Time ☐ On-Ground ☐ Unknown	Aircraft Explosion ☐ None ☐ Both Ground and In-Flight ☐ In-Flight ☐ Explosion at Unknown Time ☐ On-Ground ☐ Unknown	
Description of Damage to Aircraft and Other Property <i>(Use additional sheet if necessary)</i>			
NARRATIVE HISTORY OF FLIGHT <i>(Please type or print in ink)</i>			
Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and and location, services obtained, and intended destination. Provide as much detail as possible. The departure from X21 on the first skydiving load was approximately 9:42am and load 3 departure was approximately 10:35a local from RWY 33 with a left crosswind. Radio squelch interrupter on the VHF failed which caused a constant static. I tried troubleshooting but nothing fixed the issue so I modulated the volume as best as possible to mitigate the noise while listening for other aircraft (A/C) and/or ATC communication throughout the duration. I turned east to climb to altitude over the Indian River and then turn back northbound for setting up for jump run approximately 3-4 NM east of KTIK to intercept a W-NW track back to X21. After letting the skydivers out over the airport I set up my descent toward the east to plan for landing on 22 which the winds were favoring (I had just landed on RWY 22 with a headwind about 30 minutes prior). I completed all of the ATC radio calls on my descent and was handed off to the X21 CTAF. The static on the radio when I switched to the CTAF frequency (because the same frequency is used at multiple airports) proved to be even more difficult due to trying to decipher distant A/C communicating and availability to transmit. I made position calls as appropriate and on final I noticed the manifold pressure appeared to have dropped off to zero (0). Knowing that cylinder 4 was just replaced due to cracks a couple of days before made me concerned that I had lost power or partial power. I couldn't hear engine indications because of the static noise in my ear so I turned the radio down and proceeded to troubleshoot by applying and removing power to see if I could feel and see power changes. Because of being in a descent profile it was difficult to tell but I believed I felt the power change, so I accepted at this point it was either a partial power failure or an instrument gauge issue but either case I committed to a powered off glide path for approach to preserve altitude from my normal lower powered on approaches over treetop level into RWY 22. On final I applied 20 degrees of flaps and noticed my airspeed indicated a little shy of 100mph when crossing tree top obstacles prior to the threshold. When I touched down which was beyond the threshold and prior to TWY A it seemed much faster than I would have expected and as I applied full braking the A/C ballooned back into the air when crossing the intersecting RWY 15/33 (I have landed many times on this runway and had the A/C stopped before the intersecting RWY). At this point I contemplated a go around because of the speed but I remember not committing to the go around because of the engine issue and wouldn't want to risk being back in the air with a faulty engine (the A/C has a JPI which would be a good indication if power was applied to the engine or not because it would show an EGT and CHT temp rise for any working cylinders). After the A/C settled back on the ground I remember applying brakes again and taking the flaps out to allow more weight to be on the tires and just trying to control the A/C down the runway. It became clear the A/C was getting pushed to the right and I didn't have sufficient capability of stopping or maintaining center line as I was seeing the end of runway red reflectors approaching so I kept applying back elevator to see if I could use the last available energy the A/C had to make it across the oncoming ditch which was the final resting place of the A/C. It became clear after the incident that at some point during the landing the winds unexpectedly shifted and created a 15KT or greater tailwind.			

RECOMMENDATION (How could this accident/incident have been prevented?)
