Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Aircraft was considered a complete loss by the insurance company. From looking back at photographs, the left wing was ripped off the airplane and hanging in a tree. Upon striking a tree, the prop separated from the engine and the engine itself was ripped away from the aircraft and was laying in a field. The cockpit of the airplane was filleted open from the firewall of the aircraft to the first row of seating. Only known non-aircraft damage was to a tree or two.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The purpose of the flight in general was to take Brandon NeSmith and his flight student, Brian Teague, from HKY down to GMU Greenville, SC to pick up another plane. The other passenger, Justin Keisler of my Sunday School class, was along with me for the ride. Upon arrival from the airport, I found my plane already pulled out and Brandon said he had done a preflight on it already. I decided to do a full and complete preflight check myself, including sumping fuel from the main tanks and the gasculator. On my last flight, I burned both tips down to where they were registering zero. From what I remember, I had between 22 and 27 in each of the main tanks at start-up. All fluid levels were normal and no additional fuel was taken on. My plans were to pick up additional fuel at Shelby in route back to Hickory. I had requested VFR flight following from the HKY ground controller and had planned on completing the flight under VFR conditions. After a routine start and an exam of the instruments, nothing stood out. We patiently waited for the oil temperature to be greater than 100 degrees for full throttle and departure conditions. Upon takeoff at 1710 local time, all engine parameters were in the green and a normal take off was commencing. I raised the nose gear at 71 knots and retracted all gear shortly after verifying positive rate of climb and airspeed. Upon departure, somewhere between 300 and 400 feet AGL, I heard and felt a loud bang. The engine seized almost immediately. There was no sputtering as if for a potential restart. I confirmed with Brandon NeSmith, who is also a Certified Flight Instructor, the status of our situation; low, slow and unable to turn around and he agreed. A decision was made to land ahead and keep the airplane in control until contact with the ground. While maintaining maneuvers above stall speed over either heavily wooded areas or densely populated housing areas, the last things that I positively remember were small turns to avoid homes and other structures. My final memory was a large tree directly ahead and trying to make a slight turn with the yoke and right rudder to the right to avoid hitting the tree head on.

Operator/Owner Safety Recommendation

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)**Was there Mechanical Malfunction/Failure?** ☒ Yes ☐ No*(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)*

Failure of Teledyne Continental Motor(TCM) IO 520-BA engine. Serial # 814354-R. Full power was applied for take off after routine run-up and preflight was performed with out anything out of ordinary found. Upon retraction of the landing a normal climb out was initiated. At around an altitude of 300-400 feet AGL a "shotgun" or "Kabam" type sound was heard from the engine compartment with an immediate stoppage of the engine and prop. At an airspeed of around 85kts N246JT was rendered a glider in need of a place to put down. A hole in the top of the engine case under a magneto was photographed and sent to me.
