Route of Flight: KBED to KCDW

Pilot and passenger had flown aircraft from KCDW to KBED the previous day - June 4. Upon shut-down at KBED, tip tanks were empty, internal tanks indicating approximately half full (37 gallons usable), with right tank slightly lower than left. This is generally consistent with hours flown since previous fueling, which was at KVKX, where the aircraft was topped to 114 lbs. usable. The aircraft then flew KVKX-KCDW (IFR), KCDW-KMTP (VFR), KMTP-KCDW (VFR), KCDW-KBED (VFR), all with same PIC.

Prior to departure on June 5, aircraft took on 20 gallons of 100LL (10 per side, for a total of 57 gallons indicated) at Jet Aviation, KBED. Flight plan called for 26 gallons to KCDW, plus an additional 6-7 gallons to KDXR, the filed alternate field (KDXR was VFR at the time.), totaling approximately 32 gallons planned, leaving approximately 25 gallons in reserve - adequate for more than 45 minutes aloft. Fueling was performed in rainy conditions. Pilot performed pre-flight fuel check on both tanks, and found neither water nor contaminants. Engine oil was approximately 10 QT.

Prior to take-off at KBED, left tank indicated approximately 2/3, right slightly lower. Pilot selected left tank for take off. When left fuel reached approximately 1/2, pilot switched to right tank. Pilot noted after some time, that right tank fuel level was not descending as quickly as expected, and made a note to recheck progress later in flight. Pilot continued feeding from right tank, and monitoring for fuel level decline. Lowest level attained (on gauge) was between 1/2 and 2/3.

Pilot initiated RNAV 22 approach to KCDW with all systems functioning normally. Tower reported 1100' overcast ceiling. At approximately 700', not having broken out, pilot initiated missed approach. Soon after initiating missed approach, pilot broke out, as ceilings indeed were at approximately 1100' over KCDW. Before entering cloud, pilot attempted to engage autopilot, which engaged briefly but then failed.

Aircraft had experienced two alternator failures since installation of factory-rebuild engine, approximately 20 hours prior. These had been repaired, but pilot was concerned that electrical issues were now recurring, and could potentially result in electrical failure in IMC conditions. Pilot remained on missed-approach course 220, and requested circle to land on runway 22 from KCDW Tower.

Circling to land on runway 22, in right pattern, at approximately 900' MSL, approximately 130 knots, pilot extended landing gear and lowered flaps 15 degrees. At approximately mid-field down-wind, engine began to run rough. Pilot diverted to runway 10 and raised flaps, leaving gear extended. Full engine failure ensued during right turn to runway 10. Pilot declared engine failure on tower frequency, and reported diverting to runway 10, continuing right turn toward 10, now maintaining approximately 85 knots, and attempting engine restart, fuel still feeding from right tank. In parallel, it became evident the aircraft would not reach the runway threshold. At this point, pilot abandoned restart attempts in order to focus on landing. Pilot switched intended touch-down point from runway 10 to a grass field within the KCDW perimeter, adjacent-to and Northwest of the runway 10 threshold. Aircraft impacted at stall speed, wings-level, on grass field. Nose gear was shorn from aircraft. Left main gear collapsed. Right main gear remained intact. Aircraft spun approximately 150 degrees while skidding to a stop within approximately 100 feet. Pilot shut down electrical systems. Passenger and pilot egressed, moved away from aircraft, and awaited emergency crews.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

A. Although fuel gauges can be very accurate under some circumstances, they are subject to failure as is any instrument. They must be used in conjunction with a system of rigorously monitoring fuel burn rate on a time-unit basis in real time. This is especially true in an airplane not equipped with a fuel totalizer, as was the case here.

B. Fuel management: Consider alternating fuel tanks at set time interval versus just in accordance with indicated fuel quantity. I.e. Fly on left tank for thirty minutes, alternate to right tank for thirty minutes, and then back, etc. In this accident, fuel was flowing from the right tank, which indicated fullest, at over 1/2. If pilot's diagnosis is correct, right tank was, in fact, near empty, while left tank had at least 20 gallons remaining.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

Right fuel gauge.

Possible alternator issue, previously repaired twice. (Suspect relationship with fuel gauge.)
