Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Aircraft received an impact on the propeller.
The "CAPS" was deployed, causing damage to airframe.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Myself and a colleague were in route to KLNS from KPDK.
We established our cruise altitude at 11,500 MSL and maintained this flight level for approximately 1 hour and 30 minutes.
The new engine with only 110 hours on it was performing well and maintaining 170 TAS.
Upon passing KAVL I noticed our TAS begin to decrease.
At first the rate of decrease was not significant, but eventually decrease to 105 TAS.
Once the airspeed reached 105 I put in more power to see the influence.
The increased power had little effect on airspeed and the engine began to run rough and variable.
I immediately decided to go direct to KGEV which was to our Southeast and the closest airfield from our current position.
I began the checklist for engine power loss and engine failure and trimmed for best glide and closed the throttle for the decent.
We arrived above the field at approximately 7,000 to 8,000 feet and I began a circled decent for runway 28.
Once the field was in sight I again put in the power to see what I could expect for the short final I was preparing for.
The engine again ran very rough with variable speed and proved unreliable for any power requirements on Final.
I arranged for a short final 500 to 600 feet(approx. 4,600 MSL) above glide slope to ensure more possible airspeed if required on final and to remain in the envelope for the "CAPS."
Once the final course was established I put in significant right aileron to correct for the crosswind.
The crosswind was significant and required power to maintain the final course.
I again quickly put in power to see if we could establish any thrust adequate to correct through the crosswind, but it became clear we would not make the field.
Immediately upon this realization that the final course would not be able to be maintained the "Caps" was deployed.
I cut off fuel flow in preparation for impact and instructed my passenger to prepare for an impact.
We began our decent into the horse pasture where the plane landed initially on its nose cone and then fell to rest on its gear.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation
