Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Damage to underside of left wing, left main landing gear, front landing gear, outside right and left side of cabin. Propeller dug into ground on impact (engine not running)

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The TKS system and Pitot Tube were checked before taking off from CYKZ. Departed CYKZ on Friday January 8, 2016 at 14:00Z to KERI to clear customs. Departed KERI at 16:00Z. We picked up trace icing around KCKB. The TKS system was turned on at the normal level and the icing cleared very quickly. No further icing was encountered on route and the wings were clear of ice. I kept on checking the ATS from 60Nm from the airport. Upon contacting KCLT approach we were told to expect ILS 36R. I inputted runway 36R ILS approach. The frequency was entered and identified on both Garmin 430W units. We were given vectors for 36R and to keep the speed 135KTS or better, the autopilot was set to heading mode while vectors. We were told to switch to tower frequency. The Garmin was set to NAV mode on final. The PDF was on VLOC and the autopilot was engaged. The glide slope was captured and both flags showed white and centered. Before we broke out of the clouds the vertical flag instantly dropped without warning. At no time did the tower indicated that we were below the glide slope or not tracking the runway center line. The autopilot did not correct for any deviation. I was not looking at the moving map because my focus was on the flags and altimeter reading. When we broke out below the clouds I noticed that runway 36R was to the right but the PDF was showing a white centered flag. I told the tower that we had the runway insight, but were instructed to go around and climb to 3000ft. At which time I hand flew the aircraft. ATC instructed me to fly to KJQF and gave me vectors. I was asked if I could fly the GPS approach to runway 2 which I replied that I could. I was given the fix ECEGA which I understood to be CEGA which I could not find on the approach plate because I thought I heard 20. After I was given runway 20 again I pulled up the approach plate and found ECEGA. Inputted the runway on the #1 GPS and loaded the approach I proceeded to establish the inbound course I engaged the autopilot to go direct to ECEGA. As I engaged the autopilot the aircraft started to climb even though the altitude was set for 2400 and sharply to the right. I tried to engage the straight and level but there was no response from the autopilot. I started to receive terrain and envelope protection warnings at the same time ATC indicated that I was too low and needed to climb and turn. As I was climbing I pushed the straight and level button on the autopilot again but plane did not respond as expected and we started to experience G forces at which time I deployed the CAPS and turned off the engine and master switches. The airplane descended very rapidly with left side of the aircraft and nose down impacting the ground first. We landed on the chain link fence in the back yard of a residential property. We immediately exited the aircraft. There was no time to open the doors before the impact because the decent was very rapid.
