I was going to do a touch and go over to Plymouth Airport (PYM). I left Marshfield Airport (GHG) using RW24. I flew over the Plymouth Bay for some air work before going over to Plymouth. I later flew over to Plymouth Airport and observed both runways, 33 and 24, were being used for landing. The winds favored 24, the longer runway. I checked the ASOS and also Foreflight app on my Ipad, and the avionic weather on my 530. The sky was clear and the winds were variable, and I decided to leave Plymouth airspace and return when the winds favored RW24.

I returned after 15-20 minutes and observed two airplanes were in the downwind for RW24. I entered at a 45 degree from the downwind for RW24 as the number three plane for landing. I had to extend my downwind to allow enough time for the two slower single engine airplanes to land and exit from the runway. I called my extended downwind over the proper frequency 123.0 to traffic in the area. I also called my base and also my final for RW24 twice before landing.

The winds were still variable and someone could still try to land RW33, the shorter runway.

My flaps were extended 30 degrees for landing and my gear was down and locked as I checked the mechanical display on the floor.

As I touched down and rolled several feet, I pushed the throttles full forward for the touch and go procedure when I had a positive rate of climb and my hand was ready to retreat the flaps when I received a warning from my Avidyne TAS 620 on my Garmin 530 with a large yellow circle along with a voice warning of immediate danger which indicated a possible collision with an intruder in 15-20 seconds. These both indicators told me the Avidyne was in the most sensitive level A and an intruder was present.

I pulled the throttles back and pushed the yolk forward to land RW24, the longer runway. My gear was down with full flaps. A wind gust caught my airplane and it tipped it up to the right. The tail hit first, then the left wing tip and then the left prop. I do not remember the entire event as I was unconscious when the left wing tip hit. The right prop must have still been spinning although both props were pulled back at the same time when the intruder warning appeared, and it flipped the airplane over onto its roof. The airplane had extensive damage. Both wing tips had extensive damage, both props were destroyed, the tail was bent along with the cowings. The roof was bent posterior to the windshield when it flipped over.

I have read the Avidyne620 installation for my plane along with the instructions several times and it was in its most sensitive level, Mode A. It had both voice and display a large yellow circle on the 530W. This indicated a possible collision within 15-20 seconds with an intruder. Possibly someone was trying to land 33 and could not and decided to abort, or a low fly by on RW33 due to the winds.

Safety Recommendations by Owner

I do not know if the accident could have prevented considering the situation I was in. I have been flying for over 30 years and I have thought about this very question hundreds of times.

The C-55 Baron I was flying has the larger flaps than the newer E-55 Baron or the 58 Baron and they were fully extended. The gear was also down and locked. The nose was raised for the full power go around and the power was cut to zero thrust due to the Avidyne 620 traffic warning alert that had both voice and a large yellow display on the Garmin 530W indicating Level Sensitivity A. A large gust of wind caught my airplane and tipped it up to the right and the accident occurred.

I did not even want to be low and slow in a Baron with full flaps and the gear fully extended with no thrust, especially in a C-55 Baron with the larger flaps. My Baron also had the vortex generators to help keep the flow over the wing to lower the stall speed.

I attended Sim Com in Orlando Florida 3 years ago and we practiced aborted take off and landings. This situation of an aborted touch and go along with an Avidyne system alert could well be another good scenario to practice in the sim for pilots.

The safety recommendations I would have is to never be slow and low with full flaps and gear down with 0 degree thrust in any airplane especially a twin.
