Aircraft accident summary

N7620B KFFC

April 30, 2016

The flight in L-16A, N7620B, departed KFFC at 10:40 on April 30, 2016. Ten minutes after departure while heading southwest from Pinewood Studios south of Fayetteville at 3000 MSL the engine began to lose power. The RPM dropped to 2,000; carburetor heat was applied with no change in RPM. Carburetor heat was turned off. The magnetos were checked, both left and right, again with no change in RPM. Carb heat was again applied with still no change, and turned off. The magnetos were checked a second time, with no change in RPM. The carb heat was turned back on and remained on. Descent was approximately 200 feet/minute. Retarding the throttle resulted in further reduction of RPM. Throttle was increased to full throttle, and the RPM returned to 2,000. "Mayday" was announced on the FFC CTAF. I broadcast my location relative to the quarry south of Highway 74 in Tyrone, Georgia. Being unable to make it to FFC, I selected a field near Sandy Creek Road. The field was part of gas pipe line right of way. I made another call on the CTAF, giving my approximate location, and received a reply from an aircraft, saying they would fly toward us and try to locate us. The field selected was sufficiently long and wide for a landing. Turning about 1/2 mile final, the decision was made to leave magnetos and fuel on in case I needed to add power and reduce the rate of descent to insure that I made the field. Upon reaching the field, I decided to do a wheel landing to plant the main wheels on the ground and lower the tail as speed slowed down. However, when the wheels began to touch the hay, I realized the hay was very tall, three to four feet high. Within a second, the wheels were being retarded by the high grass. Almost instantly, as if it were a trap wire on an aircraft carrier, the wheels were caught by the grass, and we were slammed into the ground. The aircraft slide 196 feet and stopped in a 180 degree heading from where we landed. The time from the first indication of a problem to landing was about 8 minutes and final application of carb heat was 5-6 minutes. The aircraft was then secured with mags, carb heat, radios and fuel off. I checked on the condition of the passenger, and both of us were unhurt. A witness near the field came to our rescue and said he noticed the engine was sputtering, and watched us as we made the landing. Emergency services were summoned, and we remained near the aircraft until help arrived.

The airplane was flown earlier that day to insure that it was working properly and was airworthy. As a matter of interest, the landing after the check flight was a 180 degree power off accuracy spot landing, thus giving recent currency to emergency situations.
