Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Damage to left float and float rigging, damage to prop due to accident. Damage to entire aircraft engine and avionics due to sinking and recovery.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

Aircraft was untied from floating location between 2 fixed piers in preparation for a short flight around the lake. Ropes were tied from right front float cleat and left rear float cleat. I am noting that the ropes were very tight and hard to untie due to water level drop overnight. Also noting that there had been some severe storms overnight that would have caused heavy wave action. Normal preflight was performed with no other issues raising concern. Passengers were loaded and given preflight briefing including emergency procedures in the event of a water capsizing scenario. During runup and taxi I noticed the plane pulling to the left but concluded it to be wind, I ascertained the direction of a very slight breeze and began a normal water takeoff into the wind. During the takeoff the left float seemed to be pulling strongly to the left, it was all I could do to correct to the right until we got on the step, once on the step, the takeoff went normally. We flew a short 20 min flight around the lake and returned to the takeoff location for a landing. The approach was normal, gump check performed, wheels up, rudder up airspeed 75, calm seas, calm wind flaps 1 notch. The touchdown was normal, not hard or fast, landing on the step and pulling power with full back elevator. As soon as the aircraft slowed and settled off the step, the left float appeared to pull hard left and buckle, the left wing dropped to the water spinning the plane left and turning inverted in the water. We opened the doors exited the plane onto the bottom side of the wings which were floating about 6" below the water surface. We waited for a nearby ski boat to rescue us stepping off the wing and onto the bow of the boat. We then tied the ski rope to the tail of the aircraft and drug it to a nearby beach so that it wouldn't sink in the lake.

RECOMMENDATION (How could this accident/incident have been prevented?)**Operator/Owner Safety Recommendation**

Having relived the accident many times since and with the benefit of hindsight, the aircraft was telling me that something was not right with the left float on takeoff. As a relatively new float plane pilot I chocked it up to my technique instead of recognizing the signs. I could have tried to abort the takeoff but once on the step, everything felt normal. Possibly aborting the takeoff could have ended the same as the water landing did. Another hindsight action I have thought about since, was to have flown to a runway and landed on the wheels but I had convinced myself that it was me and not a structural problem.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)

Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

Left Float split along a rivet line and buckled, also parts of the float rigging failed.

Method of Exit – Describe how the occupants exited and how many occupants evacuated each location

We opened the doors exited the plane onto the bottom side of the wings which were floating about 6" below the water surface. We waited for a nearby ski boat to rescue us stepping off the wing and onto the bow of the boat. We then tied the ski rope to the tail of the aircraft and drug it to a nearby beach so that it wouldn't sink in the lake. I exited onto the left wing and my passengers exited onto the right wing.
