Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

Left Horizontal Stabilizer contacted the turf and had showed some wrinkles.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On June 10, the aircraft was released from annual inspection. PIC inspected the aircraft and found some loose screws and asked the facility to replace some O-rings on the fuel caps. Everything else appeared acceptable. The aircraft was pulled out of the hangar and the PIC started the aircraft to taxi a short distance to the fuel facility where 87 gallons of avgas was added. No abnormality was noted.

PIC wanted to inspect the aircraft in flight around the pattern for currency and to investigate the overall condition following the annual as it had been some time (about 2 years) since the aircraft was last flown. PIC was sole occupant. Normal takeoff was made at the uncontrolled field and the gear was cycled up. The aircraft stayed in the pattern and sequenced itself behind 3 other aircraft. 2 touch and goes were performed uneventfully. A final full stop landing was planned and announced to other aircraft in the pattern. On short final there was a S.E.Cessna on roll-out which had not yet vacated the runway at the end so a go-around was performed.

Upon completing the pattern and final landing to a full stop on roll-out brakes were applied approaching the end of the runway. There was no pressure to the left brake, only the right brake had any effect. The airplane started drifting to the right of the runway. As it slowed to a slow taxi speed the right deviation became more pronounced and the PIC pumped the left brake and applied pressure but it seemed that the left brake pedal went all the way to the floor with no pressure or effect. When it became evident that the aircraft would leave the runway onto the grass on the right, the PIC shut down both engines to avoid damage to the props and engines.

The aircraft rolled hard to the right and the nose traveled up an elevated grassy berm which caused the tail and left horizontal stabilizer to press into the grass as the aircraft came to a stop. PIC shut down all electrics and exited the aircraft to inspect damage. The gear was intact and did not collapse, the wings, forward fuselage, props, and engines had not received any damage. Because the tail of the aircraft had some torque because of the elevated nose, there was a little evidence of wrinkles on the very aft portion of the fuselage.

The airport was closed, local police were summoned, and a report made to the FAA. After the FAA inspector viewed emailed photos of the scene, he released the aircraft to be returned to the hangar. A recovery crew released the nitrogen charge on the nose strut which lowered the nose and allowed the tail to come off of the ground and they pushed the aircraft back but the right trim tab did contact the ground and was bent causing more damage. The aircraft was towed back to the hangar.

There was no evidence of brake fluid or any problem with the brakes. After the aircraft was towed to the hangar brakes were applied and there was pressure on both brakes. On Monday, June 13 the FAA inspector along with a FAA maintenance expert came to Apopka airport to inspect the airplane. The wing was pushed back and forth and brakes applied but they seemed to work properly. The maintenance expert explained that there is a shuttle valve which is possible to stick in a position momentarily which would release the pressure on one brake. The FAA inspector tried the brakes on the copilot side of the aircraft and found that the right brake could be pressed all the way to the floor without pressure and declared that brake unserviceable.

The FAA concluded the report and stated that the cause of the accident/incident was mechanical.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Everything was done correctly and professionally. I have seen brakes become soft and barely effective on many airplanes that haven't been flown recently. Usually with some pumping and use they begin to work better. Since there was no evidence of a problem brake before takeoff, perhaps cycling the gear had a effect on the shuttle valve.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

Left brake no pressure after landing.
