

NATIONAL TRANSPORTATION SAFETY BOARD PILOT/OPERATOR AIRCRAFT ACCIDENT/INCIDENT REPORT

This form to be used for reporting civil and public aircraft accidents and incidents

BASIC INFORMATION

Accident/Incident Location

Nearest City/Place: Somerville State: TN

ZIP: 38068 Country: United States of America

Latitude: 35°12'28"N Longitude: 089°23'40"W

(Enter in decimal degrees or degrees:minutes:seconds)

Accident/Incident Date/Time

Date: 07/14/2016 Local Time: ~7:30 PM
mm/dd/yyyy

Time Zone: CDT

Collision with Other Aircraft: ☐ Midair ☐ On-ground ☒ None

AIRCRAFT INFORMATION

Registration Number: N4714H

Manufacturer: Sorensen Danny

Model: S1-S

Serial Number: DS-1

Year of Manufacture: 1984

Amateur-Built: ☒ Yes ☐ No **If Yes:** ☒ Kit/Plans ☐ Original Design Make: Pitts Special (single place)

☐ IFR-Equipped and Certified

☐ Commercial Space Flight

☐ Unmanned Aircraft

Maximum Gross Weight: 1150 lbs

Weight at Time of Accident/Incident: ~1040 lbs

Number of Seats: 1 Flight Crew Seats: 1

Cabin Crew Seats: 0 Passenger Seats: 0

Number of Engines: 1

Category of Aircraft

- ☒ Airplane
- ☐ Balloon
- ☐ Blimp/Dirigible
- ☐ Glider

Description of Damage to Aircraft and Other Property (Use additional sheet if necessary)

Left main landing gear broke off approximately 6-8 inches above wheel axle, causing the lower left wing to strike the ground, causing a substantial crack in the rear wing spar and possibly a hairline crack in the front spar. When the wheel broke off in the grass adjacent to the runway, the nose of the aircraft struck the ground, causing the fiberglass propeller spinner to break. No visible damage to the propeller was discernible, but mud on both tips of the propeller indicate that the propeller tips contacted the sod when the airplane nosed over.

NARRATIVE HISTORY OF FLIGHT (Please type or print in ink)

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

On Thursday, July 14, 2016 I landed N4714H, an Experimental/Amateur-built Pitts Special S1-S on Runway 1 @ KFYE at approximately 7:30 PM CDT. Wind was calm at the time. After a normal 3-point landing, as the airplane was slowing down but without having applied the brakes, the airplane swerved a little; I don't recall which direction. The degree of the swerve wasn't severe and as I tapped a rudder pedal to correct the swerve, I didn't anticipate a problem. However, after correcting the initial swerve, the airplane began to swerve back and forth and I was unable to keep it aligned straight down the runway. I kept the stick held back during the swerves and the tail never attempted to come up, but after a couple of swerves, the airplane began curving toward the right (east) side of the runway. Because the speed was bleeding off during the rollout, I recall thinking that maybe I was just going to roll off into the grass without completing a ground loop, but almost as soon as the aircraft left the hard surface of the runway and entered the grass, the left wing hit the ground and the aircraft nosed over. I can't estimate the speed of the aircraft when it left the runway, but it was slow enough that I thought everything was going to be okay. The tail of the aircraft came to rest about 6-8 feet from the east side of the runway. I suffered no personal injury whatsoever and I don't even recall feeling as though I'd been slammed forward into the shoulder harnesses.

I looked through the canopy and saw that the bottom left wing was damaged and touching the ground, so I turned the fuel and mags off and exited the plane. I walked up to the terminal and the door was locked and the touchpad was inoperative. I walked back out to the airplane and called my wife to tell her what happened and that I was okay, and then I called my sons in Collierville to ask them to come pick me up. While waiting for them to arrive I took some pictures of the airplane and I removed my personal effects and the aircraft documents from the plane. After they arrived we moved the plane about 20-25 feet further east from the edge of the runway so it wouldn't be a hazard to runway operations.

After I got home I got on the internet and looked up what I should do in response to the incident described above. Because I perceived the event qualified as an accident due to the damage to the wing, I reported the incident by phone to the NTSB sometime between 10:30 and 11:00 PM CDT on the same date as the accident. I explained to the NTSB staff person what happened. He logged the information and said that I should anticipate a call from the NTSB the next day. Because the airplane was still kind of close to the runway, I called the NTSB office back the next morning to ask if it would be acceptable to move the aircraft away from the scene of the accident. They authorized the relocation, so after coordinating the movement with the KFYE airport manager, the local FAA-FSDO office, and my insurance agent, my son and I moved the airplane to the KFYE aircraft parking area by placing the gear leg in a 4x4 block on a hand dolly. Mr. Dan Merrell, the local FSDO PI/GA first looked at the airplane on the ramp. Prior to Mr. Merrell's arrival, Mr. Ed Worley, A Fayette County-based A&P Mechanic with Inspection Authorization privileges and an FAA designated Maintenance Test Examiner noticed that the broken shaft of the gear leg showed evidence of rust. He said that the rust indicated that the gear leg was cracked prior to the departure from the runway. I took pictures of the rust showing on the gear leg and provided them to Mr. Merrell. After Mr. Merrell left, my son (Zack Rice) and I relocated N4714H into the Northernmost public hangar at KFYE. It's still there.

RECOMMENDATION (How could this accident/incident have been prevented?)**Operator/Owner Safety Recommendation**

I'm a relatively high-time tailwheel pilot, with probably in excess of 3,000 flight hours and as many landings in tailwheel aircraft. When the aircraft swerved a little during the rollout, the degree of swerve didn't seem out of the ordinary for a Pitts-type aircraft. I can't explain why I was unable to get the aircraft realigned and straight down the runway after the initial swerve. With lots of time in Stearmans and other tailwheel type biplanes that are very demanding when landing on pavement, I can't explain why I was unable to keep the airplane rolling straight, because I can't pinpoint anything that I did differently during this landing than what I've done during thousands of other landings, EXCEPT, I got behind and failed to make the airplane respond as I wanted it to. I wanted to maintain a straight line down the runway and I was unable to do so.

It's possible that the type of gear that's installed on this particular airplane was a factor, but if I'd maintained a perfectly straight track down the runway, I don't think the type of gear would have come into play. N4714H has a unique, one-of-a-kind tapered rod gear that includes a 90 degree angle of bend about 8 inches above the axle. This type of landing gear produces less in-flight drag than a traditional bungee-type gear, but the angle of the bend in the gear is substantially different than the angle used by the Wolf-brand tapered rod gear that's been installed on some other Pitts-type aircraft, and that's been used in thousands of Van's RV-brand E/A-B aircraft. However, as mentioned in my write-up of the accident, the post-accident inspection of the broken landing gear hints strongly that the landing gear rod was cracked prior to the accident, as evidenced by the presence of rust on the gear leg in the area where the break occurred. It occurs to me that when the gear leg experienced a side load as a consequence of the crack, what would normally have been a recoverable swerve, wasn't, as a consequence of the crack deepening/extending with each subsequent swerve.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)**Was there Mechanical Malfunction/Failure?** ☒ Yes ☐ No*(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)*

As described above, the landing gear is a unique, one-of-a-kind gear on an Experimental/Amateur built aircraft that's noted for being particularly difficult to land on pavement. The left gear failed this time, but according to letters from a previous owner, the right gear had failed previously. I will install the more common and well-proven Wolf-style tapered-rod gear when the aircraft is repaired.

The only way that I know of to discern if the gear was cracked prior to the accident would have required removal of the gear, stripping the paint off, and doing a dye-penetrant test or an X-ray, and that isn't part of the normal inspection process for these little airplanes.
