Summary: In-flight opening of emergency exit window.

Description: On previous flight, family members reported a cold air leak coming from left side of the aircraft passenger compartment. On investigation, and prior to the next flight I inspected the area around the left passenger window from the inside of the aircraft and could see a small air gap on the lower portion of the window. I opened the window with the passenger window latch and inspected the rubber seal. It was intact but it was hard to determine if it was compressed or thinner than normal. I closed and latched the window, inspected the latch from behind the trim with a flashlight to confirm it was in place, then pushed on the bottom of the window for further verification. It gave all indications of being properly latched. Since this is a window that passengers can use on their own during ground operations it did not seem to be an issue. Because our next flight was planned to the cold northeast, after latching the window, I took several rolled up paper towels and placed them between the trim and the window to try and keep some of the cold air out (Note the weather en-route was forecast to be VFR so I wasn't concerned about moisture issues with the paper towels). As a final measure, I placed a strip of blue painters tape on the outside of the aircraft along the lower portion of the window to further reduce the entry of cold air. I had no issues with this window opening prior to this flight. My intent was to have the seal looked at when my mechanic was available and I did not ever consider it to be a flight risk. It was closed and secured.

After conducting a thorough pre-flight for our trip home, I started up to taxi to the fuel farm to fuel up for the return. It was a beautiful day in Florida so I elected to fly once around the traffic pattern prior to fueling.

Suddenly I heard an air noise in the cabin just behind my seat. I suspected the passenger window, so I engaged the auto-pilot with heading & altitude hold commands then turned to observe the window. It had opened approximately 2 inches similar to what you would find if a passenger had opened it on the ground. I reached back and closed the window then looked forward to check the aircraft. I was still on the same heading and altitude and could see the traffic just ahead and slightly to my left. A few seconds went by and then I heard a loud pop and a much stronger air noise. The auto pilot was still engaged and doing a nice job flying the aircraft so I again turned and found the window had not only re-opened but it fully released as if in the emergency exit mode. It was now not only opened but had rotated 180 degrees and was standing in a vertical position. My immediate fear was if it separated from the hinge that was holding it, there was a strong possibility of it causing damage to the elevator and/or rudder. I immediately turned and reached up high to grab the window and bring it down. After successfully pulling the door down, I looked forward to spot my traffic only to find the aircraft approaching the ground. I banked left and right to determine my location and spot any possible obstacles. I appeared to be over an open field and began to raise the nose, add power and initiate a climb. That's when I spotted a set of power lines out in front of me just above eye level. Rather than risk a hard pull with a possible stall close to the ground, I lowered the nose and put the aircraft on the ground. I was now at the edge of the field with a row of trees. I pointed the nose between the trees and braced for impact. The aircraft came to a stop and within a second or two, fire broke out in the area of the right wing. I executed an emergency evacuation of the aircraft and moved a safe distance away.

I was essentially injury free with the exception of a broken nose. Although I had a lap belt and a shoulder harness in place, I apparently stretched far enough forward to contact the glare shield.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☐ Yes ☒ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

I am not certain at this time. I had no problems with the window prior to this flight other than a complaint from passengers of cold air in that area. It is possible that the window was sprung or not latching properly, but I had no reason to ever look at it previously.
