Date Report Received

09/20/2017

On Saturday early afternoon, September 2, 2017 I was making flight plans to take my 3 nieces and one of their friends for a short flight and also their father, Mark as well. I was planning on three separate flights and that we would head up to the airport close to 4:15 PM. I then proceeded to take a 1.5 hour nap at 2pm . At the airport, I proceeded to have all 5 do the preflight with me as my wife, Deb, also a private pilot observed. During this preflight, I showed them how when I moved each aileron, that the yokes would move at the same time.

Located at KCDA, in Lyndonville Vt, On Saturday 9/02/2017 at approximately 5:30 pm, winds 230 @3, VFR flight and no clouds, I took the first flight, from runway 20, with my two great-nieces for an uneventful, 20 minute flight around the area, mostly east to Burke Mountain, then north to get a nice view of the Willoughby Gap, then to the west to show Chrystal Lake then back to KCDA to land on runway 20.

After landing, I returned to my hangar and found that my hangar tenant, John Emery had arrived and had volunteered to take up the kids father, my nephew Mark Cordz, for a flight, in his aircraft. I knew that I was to make one more flight with Mark's other daughter Tomi and her friend Amber, so I was happy that John would take Mark so that I did not need to make a third flight

It was during this time that I then told John, with my wife Debra, in attendance, to be extra careful as the density altitude seemed higher than issued as I noticed on my first flight that my airplane needed more time to build speed to take off. I then let him preflight his aircraft and to taxi ahead of me to runway 20, Winds now being calm.

Once he left the "hold short line" to runway 20, I proceeded to line up and wait at the same hold short line. It was at this time when I did my "checking flight controls routine" when I noticed that the controls, when moved both forward and backwards, right and left, that there was almost no effort or resistance. This seemed somewhat strange, but normally I have an iPad on one yoke and a garmin 560 on the other yoke, when flying cross country, but not on these local short flights. So instinctively, I moved the suction cup mounted rear view mirror on my left side door glass to re look at the stabilator to watch it move in harmony with the yokes. I then cycled the same yoke pattern 8 more times, looking at the right, left ailerons, and stabilator, to recheck the response to my inputs. As every time, I observed this, There was no delays in the response to the inputs, so I deemed the flight would be fine to continue.

I then declared that I needed a sterile cockpit as I had explained to all at the preflight briefing, the meaning of that, during both takeoff and landing at which time I would announce when they were in effect. I proceeded to enter runway 20. Once on 20 and headed south I proceeded to put in full power, with fuel pump on and full rich, and slight right rudder. I always call my speed when "live" when the airspeed indicator starts to move, and monitor it during the complete takeoff and climb procedure. As the airplane approached 78 kts, I gently rotated the aircraft to a cruise/climb speed. As the plane started to climb to about 20 to 25 feet, I felt the aircraft starting to turn to the right, while my yoke was straight.

My instinct was to correct this turn to level the wings as if perhaps some wind had just appeared from the east. I immediately noticed that the aircraft would not immediately respond, felt very little resistance to my correction. after a quick delay, the wings started to level off and now would start turning to the left as my yoke was again pointed straight ahead. I again performed an immediate correction to turn the aircraft to straight and level. At this time after a short delay, the aircraft again started turning beyond straight and level back to turning right. At this time I am leveling off from my climb and realizing that I had some type of control failure and that to continue the flight was not an option. I proceeded to point the nose down and to close the throttle to idle and look for as safe a place to land. Using what I had for yoke controls and the rudder I was able to safely land the airplane about 800 feet from the end of the runway, off to the left. Fortunately I was able to keep the nose up while striking the ground which helped stop the inertia I was carrying. Once the aircraft stopped, my passengers announced they were ok, I unbuckled my passengers and had them exit the aircraft.
