Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

The aircraft was substantially damaged. The gear was torn off and the wing tips damaged. The tail section of the aircraft was cracked. The ballistic parachute rocket was activated and the cover deployed but the parachute did not deploy.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The PIC reviewed the weather conditions, NOTAMS and TFRs for departure, arrival and his intended route. Based on this, VMC was forecast for the entire route. He then performed an extensive preflight inspection of the exterior and interior of the fuselage using the aircraft checklist to find no anomalies. There was approximately 13.5 gallons of fuel on board. The PIC had planned the flight to require about 8.25 at its normal power setting.

After securing the passenger and himself in their 3-point harnesses, the PIC performed a normal taxi and run-up using the aircraft's checklist. After finding no deficiencies, at about 1500 hrs EST, the pilot departed from Hilton Head Island Airport for the VFR, part 91, flight to 28J. The PIC requested and received Flight Following from ATC. The flight proceeded normally for about 1-1/2 hours until it was about 4.0 nm North of 28J. Without warning, while at an altitude of approximately 2,300 feet MSL, the engine suddenly stopped. An attempt to restart the engine failed.

The PIC trimmed for best glide for the weight and conditions (68 knots) and began looking for an acceptable field. Flaps were not extended. The PIC reported a MAYDAY on Guard frequency (121.5) without any response. The area within the aircraft's glide range was saturated with dense trees with power lines. The PIC scanned to find what he believed to be a suitable area for landing but it became apparent that, despite attaining best glide, the aircraft would not reach the field. The PIC then diverted to another field but appreciated that it had been clear-cut of timber and that it was unsuitable for a safe landing.

The PIC believed that the best option was to utilize the aircraft's rocket-deployed emergency parachute system. He ensured that the propeller had stopped completely. At an altitude of between 1200 and 1000 MSL, the PIC pulled the handle for the Parachute. He felt the rocket fire but the Parachute itself never deployed. Committed to a landing, the PIC continued to make a normal approach as possible, ensuring a sufficient airspeed to prevent a stall until impact. The aircraft contacted a number of stumps until coming to a sudden stop. Both the PIC and his passenger immediately felt extreme pain. They were transported via EMS to the nearest Trauma Center. Both sustained operable fractures in their lower backs and the PIC sustained crushed vertebra that required a second operation.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

The NTSB should investigate the parachute system. It had been maintained, inspected and repacked in accordance with the manufacturer's recommended instructions but failed to fire. It should be noted that various entries made by A&P mechanics reflect inaccurate "Do Not Use" dates. The manufacturer requires a 6 year repack and 12 year life for the rocket system.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No*(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)*

The Rotax 912ULS engine stopped without warning despite having been flown within the manufacturer's specifications and having been inspected in accordance with its instructions. There was sufficient fuel and oil aboard at the time of the failure. Its last 100hr/annual was performed on November 28, 2018 at 551.9 TTSN.

The parachute system failed to fire despite having been maintained, inspected and repacked in accordance with the manufacturer's recommended instructions and activated in accordance with the aircraft and parachute manufacturer's instructions. It was last repacked on 1/30/2014 with its next repack due on January, 2020. (see Log pg 28). The rocket's replacement was due in 2020. (see "Recommendations" above)
