Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

We hit the ground flat due to the CAPS deployment. As a result, the nose strut collapsed and there was damage to the bottom of the aircraft and cowling. Top of aircraft and cabin was fine. The CAPS deployment stripped sides of the airplane off for the chute to deploy.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

The following is a description of the events that occurred on September 1, 2019, as best as I can recall them, which resulted in a CAPS pull with Cirrus N878SR.

I started that day with a thorough weather briefing followed by a pre-flight; checking both tanks, sumping all 5 drain holes, checking the oil, and doing the walk-around to check all surfaces of the plane. During my walk-around, I found everything to be as it should. We took on 10 gallons a side that day giving us a total of 69.3 gallons for the airplane. When I checked the oil, I saw that we had right at 7 quarts. The start up, taxi and run up prior to takeoff were all normal. During the run up, I completed the checklist of items needed, all with normal readings.

We took off on runway 27 and began our ascent toward the Northwest. During our climb, I mentioned how well the airplane was running. At the beginning, we were climbing close to 1000 FPM, during the summertime and relatively high density altitude. I was pleased with how everything was going.

At approximately 3000 feet, I felt a slight vibration. This was something I had never felt before. I actually thought it may be a very heavy crosswind from the small cell to our left. At that time, the engine sputtered, then powered down to almost idle. I immediately turned the plane around and declared an emergency landing. As we started making our way back to KJKA, I realized the airport was rising up on my windscreen. This was a strong indication that we would not be able to make the airport. I tried cycling the throttle, but there was no change in the engine as I went full back and full forward. Either way the throttle was moved, the engine stayed at idle with no change in power. When I realized we would not make the airport, I pitched for best glide and aimed for the nearest field. At 1000 feet, the engine quite. At that moment, I made the decision to pull the CAPS system then transmitted "Mayday, Mayday, Mayday, we are going down."

Once the CAPS was pulled, we pitched down vertically for about 4 or 5 seconds. I knew at this point that this was phase one of the CAPS pull. Phase two would happen when the plane pitched back up to a flat position. When this happened, I looked out my window and saw we were under the tree line. I felt the plane slow down under the chute, then we made impact. The time between what I would call "Phase 2" and impact was about 5 seconds. If I would have waited any longer, I'm not sure we would have escaped unharmed.

The impact itself was hard, but the safety features of the Cirrus made it so that there was no impact to us individually. Each seat is made with a Honeycomb structure under the seat which absorbs the impact. As soon as we stopped, I made a personal inventory of myself and everyone on the plane. We all exited the plane and ran from it in case of a potential fire. No fire was evident and the only smell of fuel I could sense was the same as if we were on the tarmac and we just stopped after a normal flight. At that time, I went back to the cockpit and cleaned up everything. I turned off the mags, turned off avionics, pulled back the throttle and mixture, then left the plane with the doors open.

To make a very long story short; the engine quit, the chute was pulled, everyone survived with no injuries!

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

I currently don't know why the engine quite, so I can't give a recommendation at this time. We will know more after the investigation is complete.

MECHANICAL MALFUNCTION/FAILURE (If more space is needed, continue on separate sheet)Was there Mechanical Malfunction/Failure? ☒ Yes ☐ No

(If yes, list the name of the part, manufacturer, part no., serial no., and describe the failure.)

Again, I am not sure what failed. At 3000 feet, the engine powered back. As we were heading back for a hopeful emergency landing, the prop stopped completely.
