Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

The engine appeared displaced to the left. The propeller was bent. Left wing leading edge, flap, aileron, pitot tube, navigation light were all damaged. Left wing somewhat separated from the fuselage and the spar appeared damaged. Right wing flap and aileron sustained light damage and the wing was slightly separated from the fuselage. The leading edge of the right wing next to the fuselage was damaged. Wheel covers and struts were damaged. Tail cone area damaged.

Two of the runway lights were damaged. Some minor damage to the aircraft occurred during the removal and transport to the hangar.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

I had a pilot friend fly me to PYM from 6B6 at approximately 12:15 pm to pick up the Cirrus after having ADS-B installed. I departed Plymouth at about 1:30 pm. All was going well on the return trip to 6B6. Nearing 6B6 at approximately 1:50 pm, I tuned to KBED ATIS and checked the winds and pressure. I recall the winds being 12 knots, gusting to 21 knots from 340. Also I think the pressure was 29.78. Upon approaching 6B6 I set the mixture full rich. I put the boost pump on. I entered the pattern for 6B6 from a left crosswind for runway 3. I extended my downwind because I wanted a longer final. I put the flaps at 50% on downwind and 100% on base. On final I could tell the winds were fluctuating quite a bit, but it did not seem too extreme. While on final I lined up on the center line. I needed to constantly make adjustments to stay on the center line while maintaining an appropriate glide slope. I remember clearing a pine tree by 5-10 feet. The plane touched down a bit hard on the runway. Almost immediately the plane veered sharply to the left. The plane veered off the runway and was traveling in the grass next to the runway, but was still heading slightly away from the runway. I thought I might get the plane back in the air so I applied full throttle. The plane did not produce enough lift and continued to head away from the runway directly toward a thicket of brush and small saplings. After the plane came to a stop I then realized the left wing had impacted something which had caused the plane to spin around and point back in the opposite direction. I pulled the throttle and mixture back. I turned the boost pump off. I turned off the avionics, alternators and batteries. I removed the key. Then I exited the plane.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

- 1.) Due to the variable and gusting crosswinds at 6B6, a no-go decision could have made.
- 2.) Upon landing using 100% flaps, it could have been more appropriate to use 50%.
- 3.) A go-around could have been initiated prior to touchdown.
- 4.) Attention to the more than normal required right rudder input should have been better anticipated.
- 5.) Upon touchdown the nose wheel could have been held off the runway until some speed had been reduced.
