Description of Damage to Aircraft and Other Property *(Use additional sheet if necessary)*

leading edges of wings dented, one prop blade broken, small dent in spinner, left landing gear leg bent, left rear window broken, left fuselage dented forward of pilot door to firewall.

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

First test flight after maintenance, flight was to stay in the pattern. Taxied to runway, performed runup and went through checklist, performed high speed taxi to test engine during take off and flight characteristics 4 times before actual takeoff. Back taxied on runway each time. Selected right tank according to label on fuel selector valve as it was the fullest tank. Departed Runway 21 and climbed out. Made left crosswind turn, made left turn on to downwind leg. At this point the engine quit. Immediately turned left and headed back to airport, established published glide of 60-70 mph as it appeared there might be enough altitude to make it back to the runway. Looked around for suitable landing locations. Engine windmilled slowing down and came to a stop. I tried restarting the engine and checking fuel but it did not start. Shortly after that I had to focus on landing as the plane was getting lower and trees were becoming an issue. It was clear the runway could not be made so I made the decision to land straight ahead in the field. As I passed over the last trees I saw the EMS building roof and extended the glide appropriately touching down on the uphill side of the field and applying brakes. Realizing the speed was too much for the shortness of the field and that there would be an impact into the brush/trees I laid down sideways in the cockpit prior to impact. The impact was very minor and no bruises or injuries were sustained. No fuel leaked, no fire, no smoke. Airplane sustained damage mostly to leading edges of wings, left landing gear strut and one blade of the prop. Some fuselage damage left side aft of firewall to pilot door, and rear left window.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

On 10/14/2020 FAA inspector Dave Robbins noted placard on fuel selector is opposite actual operation. Left tank operation says "RIGHT" and right tank operation says "LEFT". After landing there was 12 1/2 gallons fuel in right tank and left tank was dry. Valve was tested by Dave in all three positions (Left, Right and Off) by blowing compressed air through the left and right fuel lines going to the valve and he determined the selector valve is working but labeled just the opposite of actual operation for right and left. The off position is correct.
