Post event inspection of the aircraft revealed damage to:

- 1) Nose section of aircraft including the first 3 fuselage bulkheads, corresponding skin assemblies, radome, and nose landing gear doors
- 2) Left nacelle structure including both engine mount beams and cowlings
- 3) Left wing tip and outboard lower wing skin assemblies
- 4) Left main landing gear wheel well intercoastal support and left wing auxiliary spar assembly
- 5) Rudder
- 6) Both engines and propellers

NARRATIVE HISTORY OF FLIGHT *(Please type or print in ink)*

Describe what occurred in chronological order, including circumstances leading to and nature of accident/incident. Describe terrain and include wreckage distribution sketch if pertinent. Attach extra sheets if needed. State departure time and location, services obtained, and intended destination. Provide as much detail as possible.

During a training flight on 4/26/2021, a student went missed from a circling approach to Runway 33 at Hyannis. The instructor simulated an engine failure by reducing the left throttle to idle. The student went through the memory items for the engine failure after takeoff which included switching the left auxiliary boost fuel pump to High. (The boost pump should have been simulated without actuating the switch to High). The crew was vectored for Runway 24 to conduct a simulated single-engine ILS approach to Runway 24, with a planned two engine go-around. After completing the approach, the instructor asked for the go-around at roughly 50' AGL (95kts airspeed).

The student performed the missed approach flow, but when the throttles were advanced, the airplane drifted to the left of the runway and did not climb. The student retracted the gear and flaps according to the go-around procedure, but at around 150' AGL the aircraft continued drifting to the left and the airspeed was decreasing below Vsse. When the crew realized they were going to make contact with the ground, the instructor took the flight controls (about 2500' down the runway), lowered the nose, and called for the gear down.

Upon making contact with the ground in the grass area to the left of the runway, the aircraft nose and left main landing gear collapsed. The aircraft skid along the ground, crossed taxiway Delta and veered to the left until it came to a stop about 4000' down the runway. The instructor reported to the tower that they were uninjured; they then secured and evacuated the aircraft.

RECOMMENDATION (How could this accident/incident have been prevented?)

Operator/Owner Safety Recommendation

Working on training enhancements to ensure the auxiliary boost pump is not actuated during simulated engine failures in the aircraft.

ADDITIONAL INFORMATION (Please type or print in ink)

Use this space if additional space is needed for any answers.

Based upon the fuel at the time of the approach (450 lbs) and the amount of fuel remaining in the tanks after the aircraft was recovered (350 lbs), it is assumed that roughly 16.7 gallons (100 lbs) of 100LL leaked from the aircraft into the soil. This figure was used for soil remediation planning with the airport and the Department of Environmental Protection (DEP).
